

## ADC32RF8x Dual-Channel, 3-GSPS Telecom Receiver and Feedback Devices

### 1 Features

- 14-Bit, Dual-Channel, 3-GSPS ADC
- Noise Floor:  $-155$  dBFS/Hz
- RF Input Supports Up to 4.0 GHz
- Aperture Jitter:  $90$  f<sub>S</sub>
- Channel Isolation:  $95$  dB at f<sub>IN</sub> = 1.8 GHz
- Spectral Performance (f<sub>IN</sub> = 900 MHz,  $-2$  dBFS):
  - SNR: 60.1 dBFS
  - SFDR: 66-dBc HD2, HD3
  - SFDR: 76-dBc Worst Spur
- Spectral Performance (f<sub>IN</sub> = 1.85 GHz,  $-2$  dBFS):
  - SNR: 58.9 dBFS
  - SFDR: 67-dBc HD2, HD3
  - SFDR: 76-dBc Worst Spur
- On-Chip Digital Down-Converters:
  - Up to 4 DDCs (Dual-Band Mode)
  - Up to 3 Independent NCOs per DDC
- On-Chip Input Clamp for Overvoltage Protection
- Programmable On-Chip Power Detectors with Alarm Pins for AGC Support
- On-Chip Dither
- On-Chip Input Termination
- Input Full-Scale:  $1.35$  V<sub>PP</sub>
- Support for Multi-Chip Synchronization
- JESD204B Interface:
  - Subclass 1-Based Deterministic Latency
  - 4 Lanes Per Channel at 12.5 Gbps
- Power Dissipation:  $3.2$  W/Ch at 3.0 GSPS
- 72-Pin VQFN Package ( $10$  mm ×  $10$  mm)

### 2 Applications

- Multi-Carrier GSM Cellular Infrastructure Base Stations
- Telecommunications Receivers
- DPD Observation Receivers
- Backhaul Receivers
- RF Repeaters and Distributed Antenna Systems

### 3 Description

The ADC32RF8x (ADC32RF80 and ADC32RF83) is a 14-bit, 3-GSPS, dual-channel telecom receiver and feedback device family that supports RF sampling with input frequencies up to 4 GHz and beyond. Designed for high signal-to-noise ratio (SNR), the ADC32RF8x family delivers a noise spectral density of  $-155$  dBFS/Hz as well as dynamic range and channel isolation over a large input frequency range. The buffered analog input with on-chip termination provides uniform input impedance across a wide frequency range and minimizes sample-and-hold glitch energy.

Each channel can be connected to a dual-band, digital down-converter (DDC) with up to three independent, 16-bit numerically-controlled oscillators (NCOs) per DDC for phase-coherent frequency hopping. Additionally, the ADC is equipped with front-end peak and RMS power detectors and alarm functions to support external automatic gain control (AGC) algorithms.

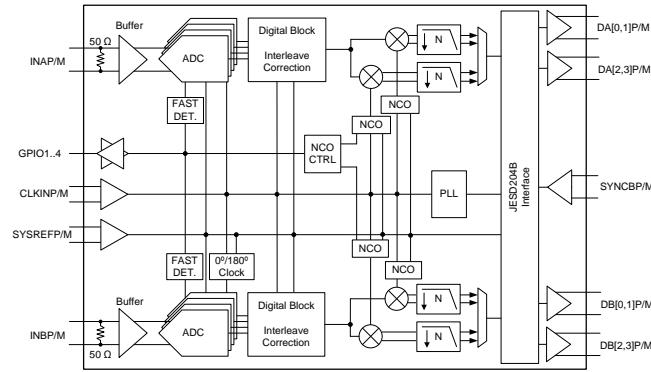

The ADC32RF8x supports the JESD204B serial interface with subclass 1-based deterministic latency using data rates up to 12.5 Gbps with up to four lanes per ADC. The device is offered in a 72-pin VQFN package ( $10$  mm ×  $10$  mm) and supports the industrial temperature range ( $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ ).

### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
ADC32RF8x	VQFN (72)	10.00 mm × 10.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 5 Pin Configuration and Functions

### Pin Functions

NAME	NO.	I/O	DESCRIPTION
<b>INPUT, REFERENCE</b>			
INAM	41	I	Differential analog input for channel A
INAP	42	I	Differential analog input for channel B
INBM	14	I	Differential analog input for channel B
INBP	13	I	Differential analog input for channel A
CM	22	O	Common-mode voltage for analog inputs, 1.2 V

**Pin Functions (continued)**

NAME	NO.	I/O	DESCRIPTION
<b>CLOCK, SYNC</b>			
CLKINM	28	I	Differential clock input for the analog-to-digital converter (ADC). This pin has an internal differential 100- $\Omega$ termination.
CLKINP	27	I	
SYSREFM	34	I	External sync input. This pin has an internal, differential 100- $\Omega$ termination and requires external biasing.
SYSREFP	33	I	
GPIO1	19	I/O	GPIO control pin; configured through the SPI. This pin can be configured to be either a fast overrange output for channel A and B, a fast detect alarm signal from the peak power detect, or a numerically-controlled oscillator (NCO) control. GPIO 4 (pin 63) can also be configured as a single-ended SYNCB input.
GPIO2	20		
GPIO3	21		
GPIO4	63		
<b>CONTROL, SERIAL</b>			
RESET	48	I	Hardware reset; active high. This pin has an internal 20-k $\Omega$ pulldown resistor.
SCLK	6	I	Serial interface clock input. This pin has an internal 20-k $\Omega$ pulldown resistor.
SDIN	5	I/O	Serial interface data input. This pin has an internal 20-k $\Omega$ pulldown resistor. SDIN can be data input in 4-wire mode, data input and output in 3 wire-mode.
SEN	7	I	Serial interface enable. This pin has an internal 20-k $\Omega$ pullup resistor to DVDD.
SDOUT	11	O	Serial interface data output in 4-wire mode
PDN	50	I	Power down; active high. This pin can be configured through an SPI register setting and can be configured to a fast overrange output channel B through the SPI. This pin has an internal 20-k $\Omega$ pulldown resistor.
<b>DATA INTERFACE</b>			
DA0M	62	O	JESD204B serial data output for channel A
DA0P	61		
DA1M	59		
DA1P	58		
DA2M	56		
DA2P	55		
DA3M	54		
DA3P	53		
DB0M	65	O	JESD204B serial data output for channel B
DB0P	66		
DB1M	68		
DB1P	69		
DB2M	71		
DB2P	72		
DB3M	1	I	Synchronization input for the JESD204B port. This pin has an LVDS or 1.8-V logic input, an optional on-chip 100- $\Omega$ termination, and is selectable through the SPI. This pin requires external biasing.
DB3P	2		
SYNCBM	36	I	Synchronization input for the JESD204B port. This pin has an LVDS or 1.8-V logic input, an optional on-chip 100- $\Omega$ termination, and is selectable through the SPI. This pin requires external biasing.
SYNCBP	35		
<b>POWER SUPPLY</b>			
AVDD19	10, 16, 24, 31, 39, 45	I	Analog 1.9-V power supply
AVDD	9, 12, 15, 17, 25, 30, 38, 40, 43, 44, 46	I	Analog 1.15-V power supply
DVDD	4, 8, 47, 51, 57, 64, 70	I	Digital 1.15 V-power supply, including the JESD204B transmitter
GND	3, 18, 23, 26, 29, 32, 37, 49, 52, 60, 67	I	Ground; shorted to thermal pad inside device

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		<b>MIN</b>	<b>MAX</b>	<b>UNIT</b>
Supply voltage range	AVDD19	-0.3	2.1	V
	AVDD	-0.3	1.4	
	DVDD	-0.3	1.4	
Voltage applied to input pins	INAP, INAM and INBP, INBM	-0.3	AVDD19 + 0.3	V
	CLKINP, CLKINM	-0.3	AVDD + 0.6	
	SYSREFP, SYSREFM, SYNCBP, SYNCBM	-0.3	AVDD + 0.6	
	SCLK, SEN, SDIN, RESET, PDN, GPIO1, GPIO2, GPIO3, GPIO4	-0.2	AVDD19 + 0.2	
Voltage applied to output pins		-0.3	2.2	V
Temperature	Operating free-air, $T_A$	-40	85	°C
	Storage, $T_{stg}$	-65	150	

(1) Stresses beyond those listed under **Absolute Maximum Ratings** may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under **Recommended Operating Conditions**. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

		<b>VALUE</b>	<b>UNIT</b>
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±1000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±500

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		<b>MIN</b>	<b>NOM</b>	<b>MAX</b>	<b>UNIT</b>
Supply voltage <sup>(1)</sup>	AVDD19	1.8	1.9	2.0	V
	AVDD	1.1	1.15	1.25	
	DVDD	1.1	1.15	1.2	
Temperature	Operating free-air, $T_A$	-40	85	°C	
	Operating junction, $T_J$	105 <sup>(2)</sup>		125	

(1) Always power up the DVDD supply (1.15 V) before the AVDD19 (1.9 V) supply. The AVDD (1.15 V) supply can come up in any order.

(2) Prolonged use above this junction temperature may increase the device failure-in-time (FIT) rate.

### 6.4 Thermal Information

<b>THERMAL METRIC<sup>(1)</sup></b>		<b>ADC32RF80</b>	<b>UNIT</b>
		<b>RMP (VQFN)</b>	
		<b>72 PINS</b>	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	21.8	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	4.4	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	2.0	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.1	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	2.0	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	0.2	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics

typical values are specified at an ambient temperature of 25°C; minimum and maximum values are specified over an ambient temperature range of –40°C to +85°C; and chip sampling rate = 2949.12 MSPS, 50% clock duty cycle, DDC-bypassed performance, AVDD19 = 1.9 V, AVDD = 1.15 V, DVDD = 1.15 V, –2-dBFS differential input, and 0-dB digital gain (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>POWER CONSUMPTION<sup>(1)</sup> (Dual-Channel Operation, Both Channels A and B are Active; Divide-by-4, Complex Output Mode<sup>(2)</sup>)</b>					
I <sub>AVDD19</sub>	1.9-V analog supply current $f_S = 2949.12 \text{ MSPS}$	1777	1989	1989	mA
I <sub>AVDD</sub>	1.15-V analog supply current $f_S = 2949.12 \text{ MSPS}$	970	1103	1103	mA
I <sub>DVDD</sub>	1.15-V digital supply current $f_S = 2949.12 \text{ MSPS}$	1785	1955	1955	mA
P <sub>D</sub>	Power dissipation $f_S = 2949.12 \text{ MSPS}$	6.54	7.07	7.07	W
Global power-down power dissipation		360			mW
<b>ANALOG INPUTS</b>					
Resolution		14			Bits
Differential input full-scale		1.35			V <sub>PP</sub>
V <sub>IC</sub>	Input common-mode voltage	1.2 <sup>(3)</sup>			V
R <sub>IN</sub>	Input resistance	65			Ω
C <sub>IN</sub>	Input capacitance	2			pF
V <sub>CM</sub>	common-mode voltage output	1.2			V
Analog input bandwidth (–3-dB point)	ADC driven with 50-Ω source	3200			MHz
<b>ISOLATION</b>					
Crosstalk isolation between channel A and channel B <sup>(4)</sup>	f <sub>IN</sub> = 100 MHz	100	dBc		
	f <sub>IN</sub> = 900 MHz	99			
	f <sub>IN</sub> = 1800 MHz	95			
	f <sub>IN</sub> = 2700 MHz	86			
	f <sub>IN</sub> = 3500 MHz	85			
<b>CLOCK INPUT<sup>(5)</sup></b>					
Input clock frequency		1.5	3		GSPS
Differential (peak-to-peak) input clock amplitude		0.5	1.5	2.5	V <sub>PP</sub>
Input clock duty cycle		45%	50%	55%	
Internal clock biasing		1.0			V
Internal clock termination (differential)		100			Ω

- (1) See the [Power Consumption in Different Modes](#) section for more details.
- (2) Full-scale signal is applied to the analog inputs of all active channels.
- (3) When used in dc-coupling mode, the common-mode voltage at the analog inputs should be kept within V<sub>CM</sub> ±25 mV for best performance.
- (4) Crosstalk is measured with a –2-dBFS input signal on aggressor channel and no input on the victim channel.
- (5) See [Figure 79](#).

## 6.6 AC Performance Characteristics: $f_s = 2949.12 \text{ MSPS}$

typical values specified at an ambient temperature of 25°C; minimum and maximum values are specified over an ambient temperature range of -40°C to +85°C; and chip sampling rate = 2949.12 MSPS, 50% clock duty cycle, DDC-bypassed performance<sup>(1)</sup>, AVDD19 = 1.9 V, AVDD = 1.15 V, DVDD = 1.15 V, -2-dBFS differential input, and 0-dB digital gain (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN <sup>(2)</sup>	NOM	MAX	UNIT
SNR Signal-to-noise ratio	$f_{IN} = 100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	62.6			dBFS
	$f_{IN} = 900 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	61.1			
	$f_{IN} = 1850 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	55.4	58.9		
	$f_{IN} = 2100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$		58.2		
	$f_{IN} = 2600 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$		56.8

	$f_{IN} = 2600 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$		148.5		
	$f_{IN} = 3500 \text{ MHz}, A_{OUT}^{(3)} = -3 \text{ dBFS with 2-dB gain}$		145.8		
Small-signal SNR	$f_{IN} = 1850 \text{ MHz}, A_{OUT} = -40 \text{ dBFS}$	63.1			dBFS
NF <sup>(4)</sup> Noise figure	$f_{IN} = 1850 \text{ MHz}, A_{OUT} = -40 \text{ dBFS}$	24.7			dB
SINAD Signal-to-noise and distortion ratio	$f_{IN} = 100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	61.7			dBFS
	$f_{IN} = 900 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	60.2			
	$f_{IN} = 1850 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	58.4			
	$f_{IN} = 2100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	57.6			
	$f_{IN} = 2600 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	54.8			
	$f_{IN} = 3500 \text{ MHz}, A_{OUT}^{(3)} = -3 \text{ dBFS with 2-dB gain}$	53.6			
ENOB Effective number of bits	$f_{IN} = 100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	10.0			Bits
	$f_{IN} = 900 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	9.7			
	$f_{IN} = 1850 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	9.4			
	$f_{IN} = 2100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	9.3			
	$f_{IN} = 2600 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	8.8			
	$f_{IN} = 3500 \text{ MHz}, A_{OUT}^{(3)} = -3 \text{ dBFS with 2-dB gain}$	8.6			
SFDR Spurious-free dynamic range	$f_{IN} = 100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	68.0			dBc
	$f_{IN} = 900 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	66.0			
	$f_{IN} = 1850 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	58	67.0		
	$f_{IN} = 2100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$		64.0		
	$f_{IN} = 2600 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$		58.0		
	$f_{IN} = 3500 \text{ MHz}, A_{OUT}^{(3)} = -3 \text{ dBFS with 2-dB gain}$		62.0		
HD2 <sup>(5)</sup> Second-order harmonic distortion	$f_{IN} = 100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	72.0			dBc
	$f_{IN} = 900 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	73.0			
	$f_{IN} = 1850 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	58	67.0		
	$f_{IN} = 2100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$		64.0		
	$f_{IN} = 2700 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$		58.0		
	$f_{IN} = 3500 \text{ MHz}, A_{OUT}^{(3)} = -3 \text{ dBFS with 2-dB gain}$		62.0		

(1) Performance is shown with DDC bypassed. When DDC is enabled, performance improves by the decimation filtering process.

(2) Minimum values are specified at  $A_{OUT} = -3 \text{ dBFS}$ .

(3) Output amplitude,  $A_{OUT}$ , refers to the signal amplitude in the ADC digital output that is same as the analog input amplitude,  $A_{IN}$ , except when the digital gain feature is used. If digital gain is G, then  $A_{OUT} = G + A_{IN}$ .

(4) The ADC internal resistance = 65 Ω, the driving source resistance = 50 Ω.

(5) The minimum value of HD2 is specified by bench characterization.

## AC Performance Characteristics: $f_s = 2949.12 \text{ MSPS}$ (continued)

typical values specified at an ambient temperature of  $25^\circ\text{C}$ ; minimum and maximum values are specified over an ambient temperature range of  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$ ; and chip sampling rate =  $2949.12 \text{ MSPS}$ , 50% clock duty cycle, DDC-bypassed performance<sup>(1)</sup>, AVDD19 =  $1.9 \text{ V}$ , AVDD =  $1.15 \text{ V}$ , DVDD =  $1.15 \text{ V}$ ,  $-2\text{-dBFS}$  differential input, and 0-dB digital gain (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN <sup>(2)</sup>	NOM	MAX	UNIT
HD3 Third-order harmonic distortion	$f_{IN} = 100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	68.0			dBc
	$f_{IN} = 900 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	66.0			
	$f_{IN} = 1850 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	61	73.0		
	$f_{IN} = 2100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$		80.0		
	$f_{IN} = 2600 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$		72.0		
	$f_{IN} = 3500 \text{ MHz}, A_{OUT}^{(3)} = -3 \text{ dBFS with 2-dB gain}$		65.0		
HD4, HD5 Fourth- and fifth-order harmonic distortion	$f_{IN} = 100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	85.0			dBc
	$f_{IN} = 900 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	81.0			
	$f_{IN} = 1850 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	61	84.0		
	$f_{IN} = 2100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$		84.0		
	$f_{IN} = 2600 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$		80.0		
	$f_{IN} = 3500 \text{ MHz}, A_{OUT}^{(3)} = -3 \text{ dBFS with 2-dB gain}$		87.0		
IL spur Interleaving spurs: $f_s / 2 - f_{IN}$ , $f_s / 4 \pm f_{IN}$	$f_{IN} = 100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	90.0			dBc
	$f_{IN} = 900 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	77.0			
	$f_{IN} = 1850 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	69	79.0		
	$f_{IN} = 2100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$		76.0		
	$f_{IN} = 2600 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$		77.0		
	$f_{IN} = 3500 \text{ MHz}, A_{OUT}^{(3)} = -3 \text{ dBFS with 2-dB gain}$		77.0		
HD2 IL Interleaving spur for HD2: $f_s / 2 - HD2$	$f_{IN} = 100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	84.0			dBc
	$f_{IN} = 900 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	82.0			
	$f_{IN} = 1850 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	62	80.0		
	$f_{IN} = 2100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$		76.0		
	$f_{IN} = 2600 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$		65.0		
	$f_{IN} = 3500 \text{ MHz}, A_{OUT}^{(3)} = -3 \text{ dBFS with 2-dB gain}$		77.0		
Worst spur Spurious-free dynamic range (excluding HD2, HD3, HD4, HD5, and interleaving spurs IL and HD2 IL)	$f_{IN} = 100 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	80.0			dBc
	$f_{IN} = 900 \text{ MHz}, A_{OUT} = -2 \text{ dBFS}$	76.0

C <sub>o</sub>	Output capacitance	Output capacitance inside the device, from either output to ground		2	pF

## 6.10 Timing Requirements

typical values are specified at an ambient temperature of 25°C; minimum and maximum values are specified over an ambient temperature range of -40°C to +85°C; and chip sampling rate = 2949.12 MSPS, 50% clock duty cycle, DDC-bypassed performance, AVDD19 = 1.9 V, AVDD = 1.15 V, DVDD = 1.15 V, -2-dBFS differential input, and 0-dB digital gain (unless otherwise noted)

		<b>MIN</b>	<b>NOM</b>	<b>MAX</b>	<b>UNIT</b>
<b>SAMPLE TIMING</b>					
	Aperture delay	250	750	ps	
	Aperture delay matching between two channels on the same device		±15	ps	
	Aperture delay matching between two devices at the same temperature and supply voltage		±150	ps	
	Aperture jitter, clock amplitude = 2 V <sub>PP</sub>		90	f <sub>S</sub>	
Latency (1)(2)	Data latency, ADC sample to digital output DDC block bypassed <sup>(3)</sup> , LMFS = 8224		424		Input clock cycles
	Fast overrange latency, ADC sample to FOVR indication on GPIO pins		70		
t <sub>PD</sub>	Propagation delay time: logic gates and output buffer delay (does not change with f <sub>S</sub> )		6		ns
<b>SYSREF TIMING<sup>(4)</sup></b>					
t <sub>SU_SYSREF</sub>	SYSREF setup time: referenced to clock rising edge, 2949.12 MSPS	140	70	ps	
t <sub>H_SYSREF</sub>	SYSREF hold time: referenced to clock rising edge, 2949.12 MSPS	50	20	ps	
	Valid transition window sampling period: t <sub>SU_SYSREF</sub> – t <sub>H_SYSREF</sub> , 2949.12 MSPS	143		ps	
<b>JESD OUTPUT INTERFACE TIMING</b>					
UI	Unit interval: 12.5 Gbps	80	100	400	ps
	Serial output data rate	2.5	10.0	12.5	Gbps
	Rise, fall times: 1-pF, single-ended load capacitance to ground	60		ps	
	Total jitter: BER of 1E-15 and lane rate = 12.5 Gbps	25		%UI	
	Random jitter: BER of 1E-15 and lane rate = 12.5 Gbps	0.99		%UI, rms	
	Deterministic jitter: BER of 1E-15 and lane rate = 12.5 Gbps	9.1		%UI, pk-pk	

(1) Overall latency = latency + t<sub>PD</sub>.

(2) Latency increases when the DDC modes are used; see [Table 5](#).

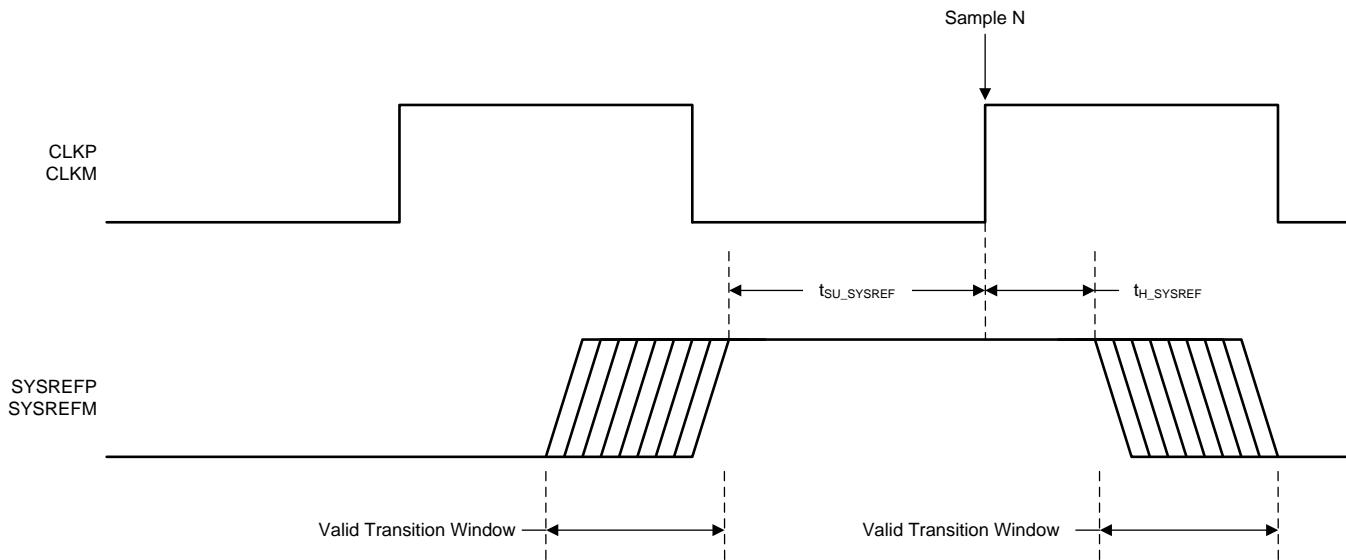

(3) For latency in different DDC options, see .

(4) Common-mode voltage for the SYSREF input is kept at 1.2 V.

$V_{OCM}$  is not the same as  $V_{ICM}$ . Similarly,  $V_{OD}$  is not the same as  $V_{ID}$ .

## 7 Parameter Measurement Information

### 7.1 Input Clock Diagram

Figure 79 shows the input clock diagram.

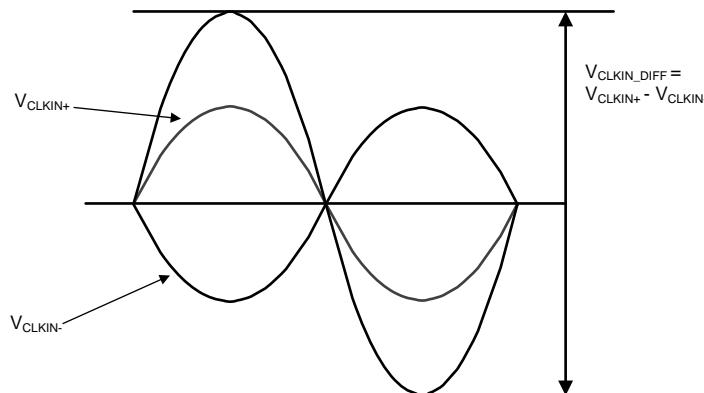

Figure 79. Input Clock Diagram

## 8 Detailed Description

### 8.1 Overview

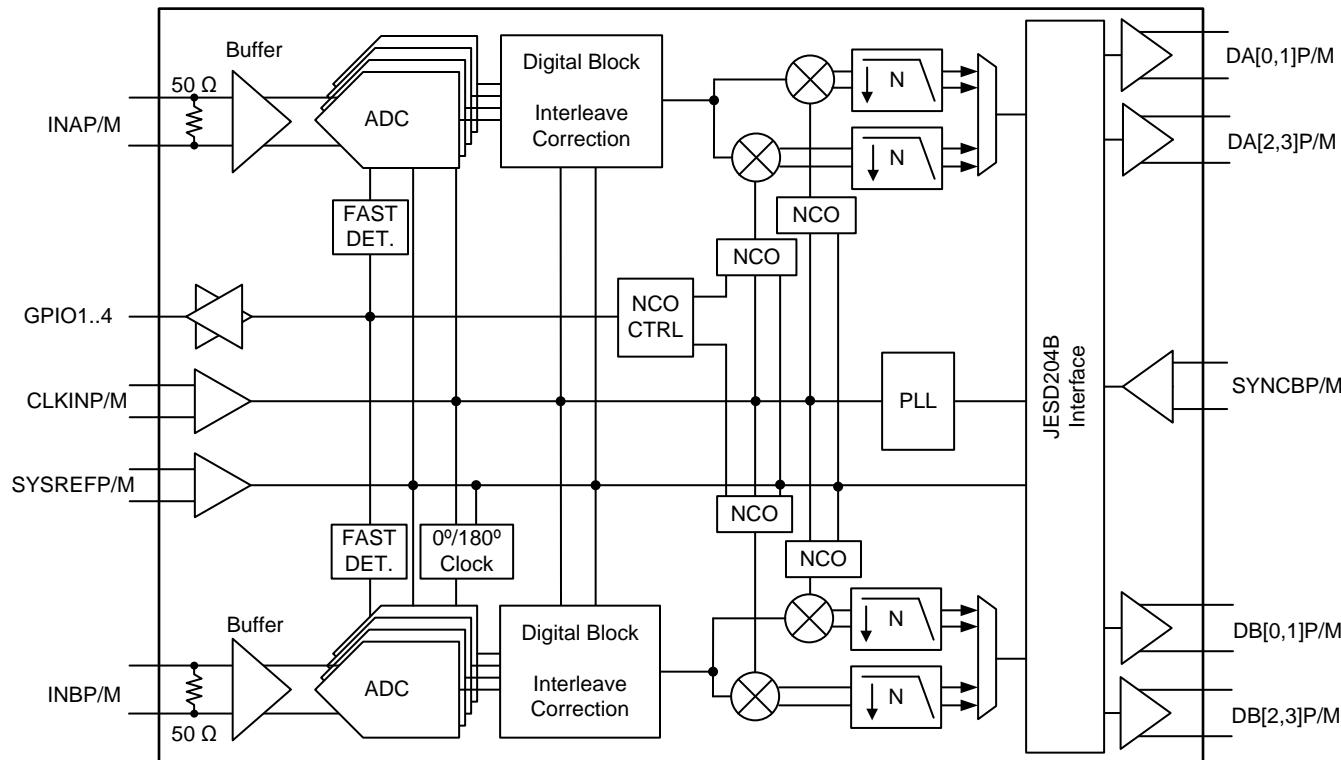

The ADC32RF8x is a dual, 14-bit, 2949.12-MSPS, telecom receiver and feedback device family containing analog-to-digital converters (ADCs) followed by multi-band digital down-converters (DDCs), and a back-end JESD204B digital interface.

The ADCs are preceded by input buffers and on-chip termination to provide a uniform input impedance over a large input frequency range. Furthermore, an internal differential clamping circuit provides first-level protection against overvoltage conditions. Each ADC channel is internally interleaved four times and equipped with background, analog and digital, and interleaving correction.

The on-chip DDC enables single- or dual-band internal processing to pre-select and filter smaller bands of interest and also reduces the digital output data traffic. Each DDC is equipped with up to three independent, 16-bit numerically-controlled oscillators (NCOs) for phase coherent frequency hopping; the NCOs can be controlled through the SPI or GPIO pins. The ADC32RF8x also provides three different power detectors on-chip with alarm outputs in order to support external automatic gain control (AGC) loops.

The processed data are passed into the JESD204B interface where the data are framed, encoded, serialized, and output on one to four lanes per channel, depending on the ADC sampling rate and decimation. The CLKIN, SYSREF, and SYNCB inputs provide the device clock and the SYSREF and SYNCB signals to the JESD204B interface that are used to derive the internal local frame and local multiframe clocks and establish the serial link. All features of the ADC32RF8x are configurable through the SPI.

## 8.3 Feature Description

### 8.3.1 Analog Inputs

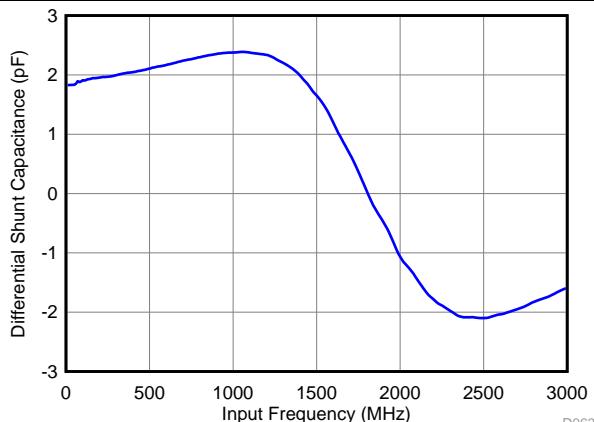

The ADC32RF8x analog signal inputs are designed to be driven differentially. The analog input pins have internal analog buffers that drive the sampling circuit. The ADC32RF8x provides on-chip, differential termination to minimize reflections. The buffer also helps isolate the external driving circuit from the internal switching currents of the sampling circuit, thus resulting in a more constant SFDR performance across input frequencies.

The common-mode voltage of the signal inputs is internally biased to CM using the  $32.5\text{-}\Omega$  termination resistors that allow for ac-coupling of the input drive network. [Figure 80](#) and [Figure 81](#) show SDD11 at the analog inputs from dc to 5 GHz with a  $100\text{-}\Omega$  reference impedance.

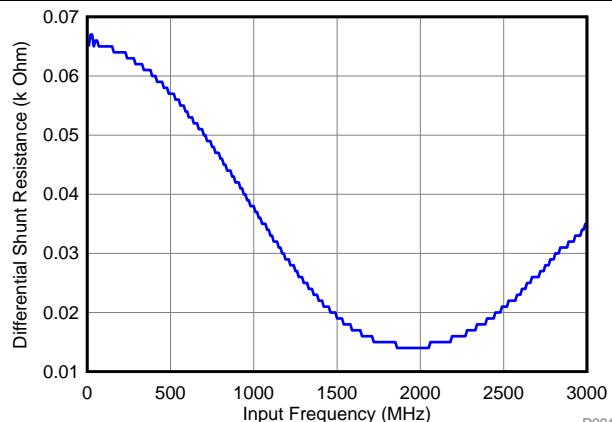

## Feature Description (continued)

The input impedance of analog inputs can also be modelled as parallel combination of equivalent resistance and capacitance. [Figure 82](#) and [Figure 83](#) show how equivalent impedance ( $C_{IN}$  and  $R_{IN}$ ) vary over frequency.

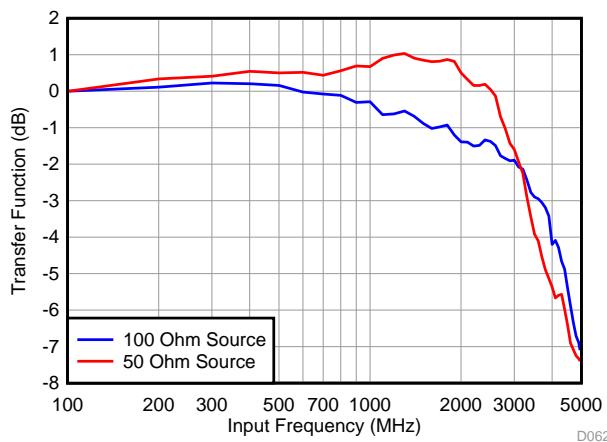

**Figure 82. Differential Input Capacitance vs Input Frequency**

**Figure 83. Differential Input Resistance vs Input Frequency**

Each input pin (INP, INM) must swing symmetrically between  $(CM + 0.3375\text{ V})$  and  $(CM - 0.3375\text{ V})$ , resulting in a  $1.35\text{-V}_{PP}$  (default) differential input swing. The input sampling circuit has a 3-dB bandwidth that extends up to approximately 3.2 GHz, as shown in [Figure 84](#).

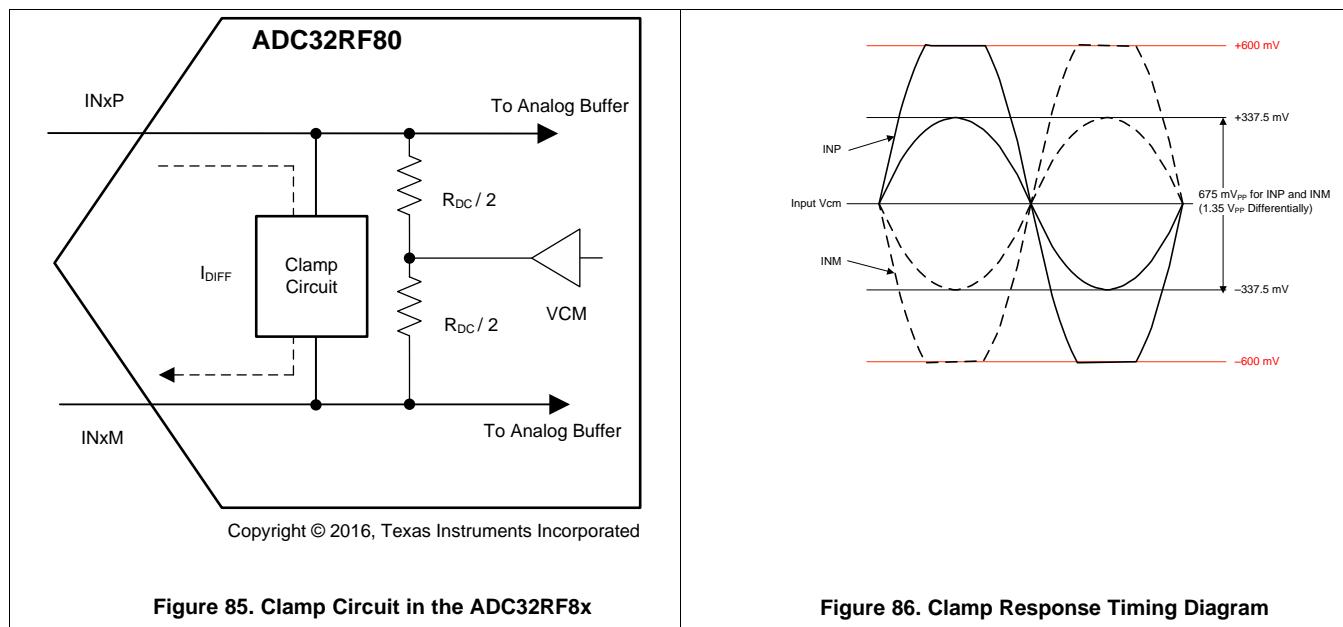

**Figure 84. Input Bandwidth with a  $100\text{-}\Omega$  Source Resistance**

## Feature Description (continued)

### 8.3.1.1 Input Clamp Circuit

The ADC32RF8x analog inputs include an internal, differential clamp for overvoltage protection. The clamp triggers for any input signals at approximately 600 mV above the input common-mode voltage, effectively limiting the maximum input signal to approximately 2.4 V<sub>PP</sub>, as shown in [Figure 85](#) and [Figure 86](#).

When the clamp circuit conducts, the maximum differential current flowing through the circuit (via input pins) must be limited to 20 mA.

## Feature Description (continued)

### 8.3.2 Clock Input

The ADC32RF8x sampling clock input includes internal 100- $\Omega$  differential termination along with on-chip biasing. The clock input is recommended to be ac-coupled externally. The input bandwidth of the clock input is approximately 3 GHz; the clock input impedance is shown with a 100- $\Omega$  reference impedance in the smith chart of Figure 87.

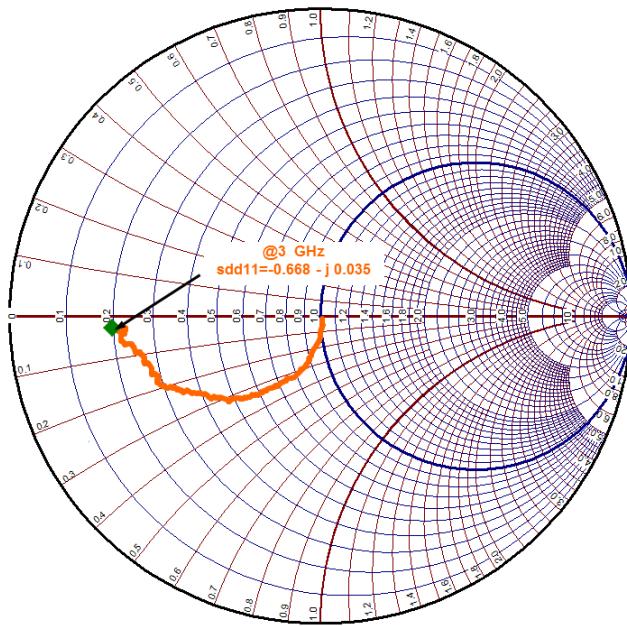

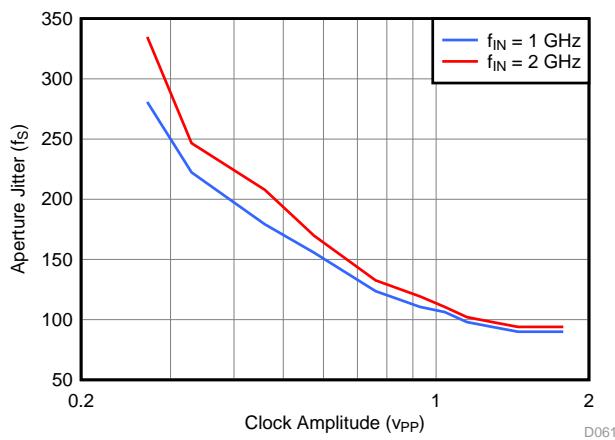

Figure 87. SDD11 of the Clock Input

## Feature Description (continued)

The analog-to-digital converter (ADC) aperture jitter is a function of the clock amplitude applied to the pins. The equivalent aperture jitter for input frequencies at a 1-GHz and a 2-GHz input is shown in [Figure 88](#). Depending on the clock frequency, a matching circuit can be designed in order to maximize the clock amplitude.

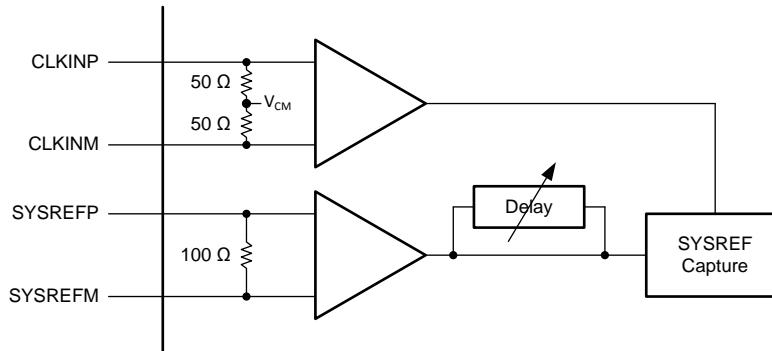

**Figure 88. Equivalent Aperture Jitter vs Input Clock Amplitude**

### 8.3.3 SYSREF Input

The SYSREF signal is a periodic signal that is sampled by the ADC32RF8x device clock and is used to align the boundary of the local multiframe clock inside the data converter. SYSREF is also used to reset critical blocks [such as the clock divider for the interleaved ADCs, numerically-controlled oscillators (NCOs), decimation filters and so forth].

The SYSREF input requires external biasing. Furthermore, SYSREF must be established before the SPI registers are programmed. A programmable delay on the SYSREF input, as shown in [Figure 89](#), is available to help with skew adjustment when the sampling clock and SYSREF are not provided from the same source.

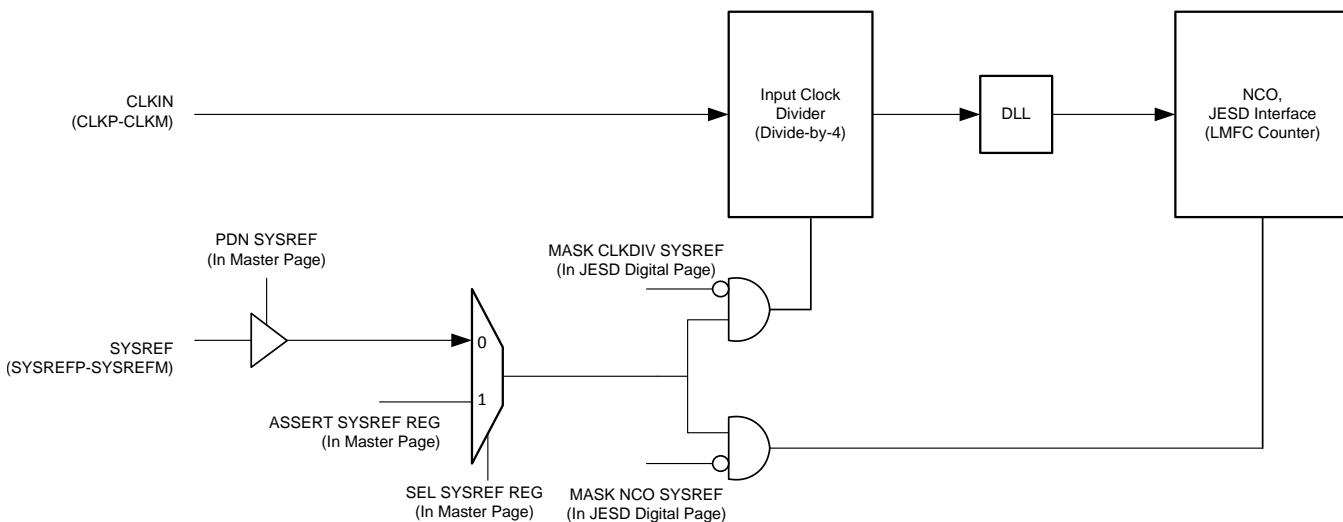

**Figure 89. SYSREF Internal Circuit Diagram**

## Feature Description (continued)

### 8.3.3.1 Using SYSREF

The ADC32RF8x uses SYSREF information to reset the clock divider, the NCO phase, and the LMFC counter of the JESD interface. The device provides flexibility to provide SYSREF information either from dedicated pins or through SPI register bits. SYSREF is asserted by a low-to-high transition on the SYSREF pins or a 0-to-1 change in the ASSERT SYSREF REG bit when using SPI registers, as shown in [Figure 90](#).

**Figure 90. Using SYSREF to Reset the Clock Divider, the NCO, and the LMFC Counter**

The ADC32RF8x samples the SYSREF signal on the input clock rising edge. Required setup and hold time are listed in the [Timing Requirements](#) table. The input clock divider gets reset each time that SYSREF is asserted, whereas the NCO phase and the LMFC counter of the JESD interface are reset on each SYSREF assertion after disregarding the first two assertions, as shown in [Table 1](#).

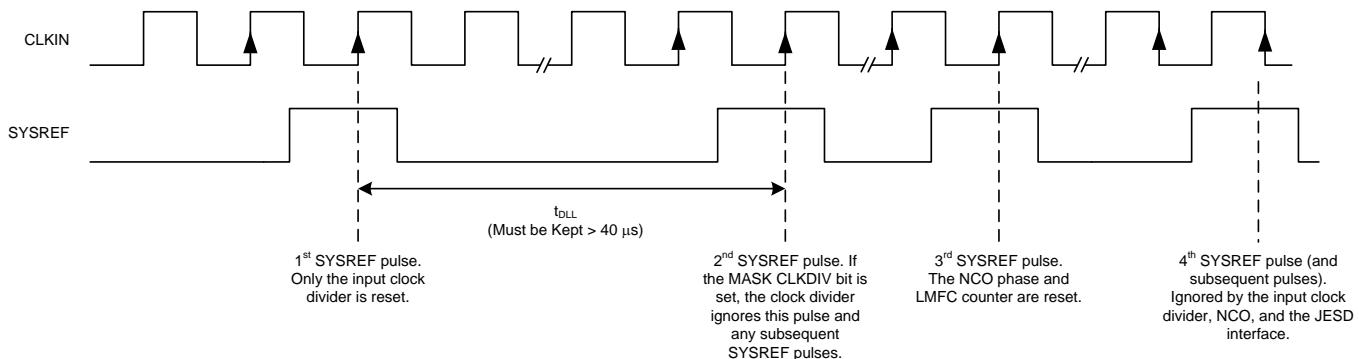

**Table 1. Asserting SYSREF**

SYSREF ASSERTION INDEX	ACTION		
	INPUT CLOCK DIVIDER	NCO PHASE	LMFC COUNTER
1	Gets reset	Does not get reset	Does not get reset
2	Gets reset	Does not get reset	Does not get reset
3	Gets reset	Gets reset	Gets reset
4 and onwards	Gets reset	Gets reset	Gets reset

The SESREF use-cases can be classified broadly into two categories:

- SYSREF is applied as aperiodic multi-shot pulses.

**Figure 91** shows a case when only a counted number of pulses are applied as SYSREF to the ADC.

1 (The input clock divider ignores the SYSREF pulses.)

1 (The NCO and LMFC counter of the JESD interface  
ignore the SYSREF pulses.)

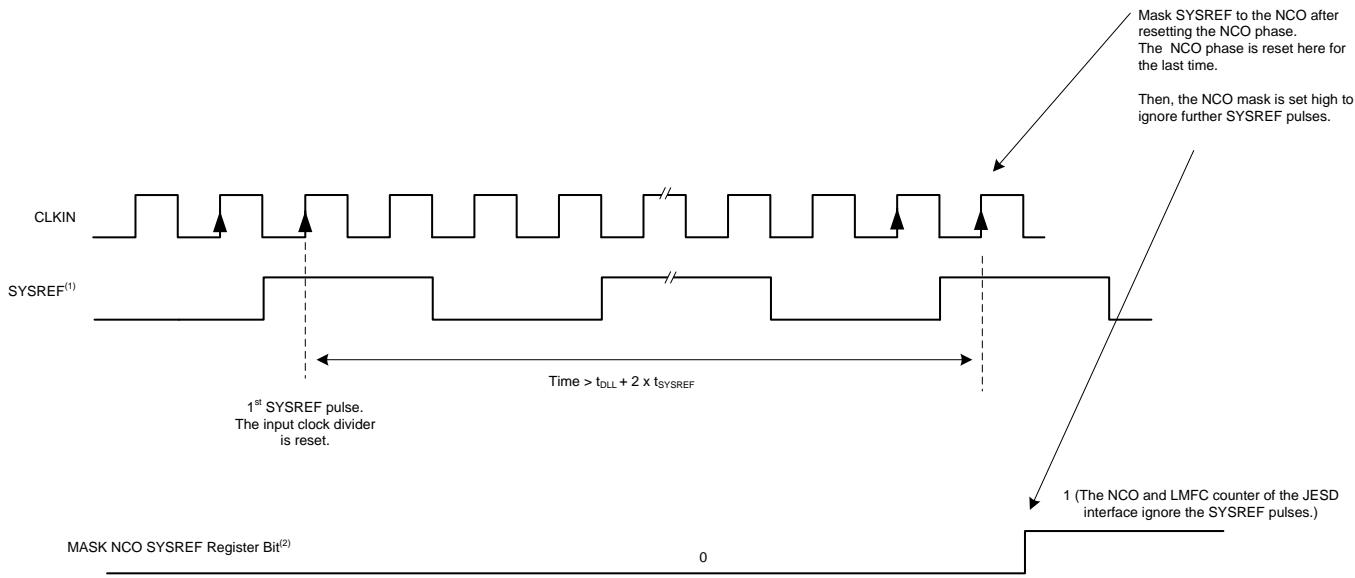

Alternatively, the SYSREF buffer can be powered down with the PDN SYSREF bit.

**Figure 91. SYSREF Used as a Periodic, Finite Number of Pulses**

After the first SYSREF pulse is applied, allow the DLL in the clock path to settle by waiting for the  $t_{DLL}$  time ( $> 40 \mu s$ ) before applying the second pulse. During this time, mask the SYSREF going to the input clock divider by setting the MASK CLKDIV SYSREF bit so that the divider output phase remains stable. The NCO phase and LMFC counter are reset on the third SYSREF pulse. After the third SYSREF pulse, the SYSREF going to the NCO and JESD block can be disabled by setting the MASK NCO SYSREF bit to avoid any unwanted resets.

2. SYSREF is applied as a periodic pulse.

Figure 92 shows how SYSREF can be applied as a continuous periodic waveform.

$t_{SYSREF}$  is a period of the SYSREF waveform.

Alternatively, the SYSREF buffer can be powered down using the PDN SYSREF bit.

**Figure 92. SYSREF Used as a Periodic Waveform**

After applying the SYSREF signal, DLL must be allowed to lock, and the NCO phase and LMFC counter must be allowed to reset by waiting for at least the  $t_{DLL}$  (40  $\mu$ s) +  $2 \times t_{SYSREF}$  time. Then, the SYSREF going to the NCO and JESD can be masked by setting the MASK NCO SYSREF register bit.

### 8.3.3.2 Frequency of the SYSREF Signal

When SYSREF is a periodic signal, its frequency is required to be a sub-harmonic of the internal local multi-frame clock (LMFC) frequency, as described in [Equation 1](#). The LMFC frequency is determined by the selected decimation, frames per multi-frame setting (K), samples per frame (S), and device input clock frequency.

$$\text{SYSREF} = \text{LMFC} / N$$

where

- N is an integer value (1, 2, 3, and so forth)
- (1)

In order for the interleaving correction engine to synchronize properly, the SYSREF frequency must also be a multiple of  $f_S / 64$ . [Table 2](#) provides a summary of the valid LMFC clock settings.

**Table 2. . SYSREF and LMFC Clock Frequency**

OPERATING MODE	LMFS SETTING	LMFC CLOCK FREQUENCY	SYSREF FREQUENCY
Decimation	Various	$f_S^{(1)} / (D \times S^{(2)} \times K^{(3)})$	$f_S / (N \times \text{LCM}^{(4)} (64, D^{(5)} \times S \times K))$

(1)  $f_S$  = sampling (device) clock frequency.

(2) S = samples per frame.

(3) K = number of frames per multi-frame.

(4) LCM = least-common multiple.

(5) D = decimation ratio.

The SYSREF signal is recommended to be a low-frequency signal less than 5 MHz in order to reduce coupling to the signal path both on the printed circuit board (PCB) as well as internal to the device.

**Example:  $f_S = 2949.12 \text{ MSPS}$ , Divide-by-4 (LMFS = 8411), K = 16**

$$\text{SYSREF} = 2949.12 \text{ MSPS} / \text{LCM } (4, 64, 16) = 46.08 \text{ MHz} / N$$

Operate SYSREF at 2.88 MHz (effectively divide-by-1024, N = 16)

For proper device operation, disable the SYSREF signal after the JESD synchronization is established.

### 8.3.4 DDC Block

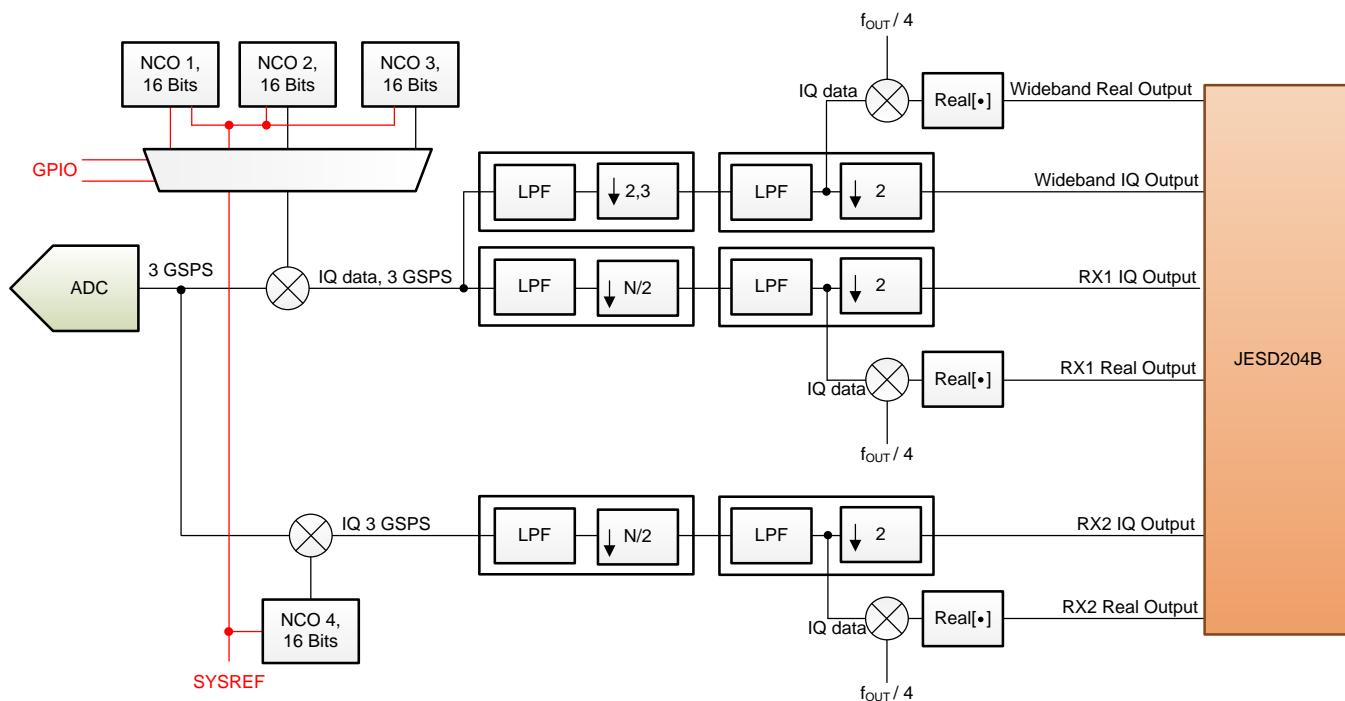

The ADC32RF8x provides a sophisticated on-chip, digital down converter (DDC) block that can be controlled through SPI register settings and the general-purpose input/output (GPIO) pins. The DDC block supports two basic operating modes: receiver (RX) mode with single- or dual-band DDC and wide-bandwidth observation receiver mode.

Note that the ADC32RF80 and ADC32RF83 are identical devices except the fact that the ADC32RF83 offers only single-band DDC option whereas the ADC32RF80 offers both single-band and dual-band DDC options, as shown in [Table 3](#).

**Table 3. DDC Option Availability**

DDC OPTION	AVAILABILITY IN DEVICE
Wide-band DDC	ADC32RF80, ADC32RF83
Single-band DDC	ADC32RF80, ADC32RF83
Dual-band DDC	ADC32RF80 only

Each ADC channel is followed by two DDC chains consisting of the digital filter along with a complex digital mixer with a 16-bit numerically-controlled oscillator (NCO), as shown in [Figure 93](#). The NCOs allow accurate frequency tuning within the Nyquist zone prior to the digital filtering. One DDC chain is intended for supporting a dual-band DDC configuration in receiver mode and the second DDC chain supports the wide-bandwidth output option for the observation configuration. At any given time, either the single-band DDC, the dual-band DDC, or the wideband DDC can be enabled. Furthermore, three different NCO frequencies can be selected on that path and are quickly switched using the SPI or the GPIO pins to enable wide-bandwidth observation in a multi-band application.

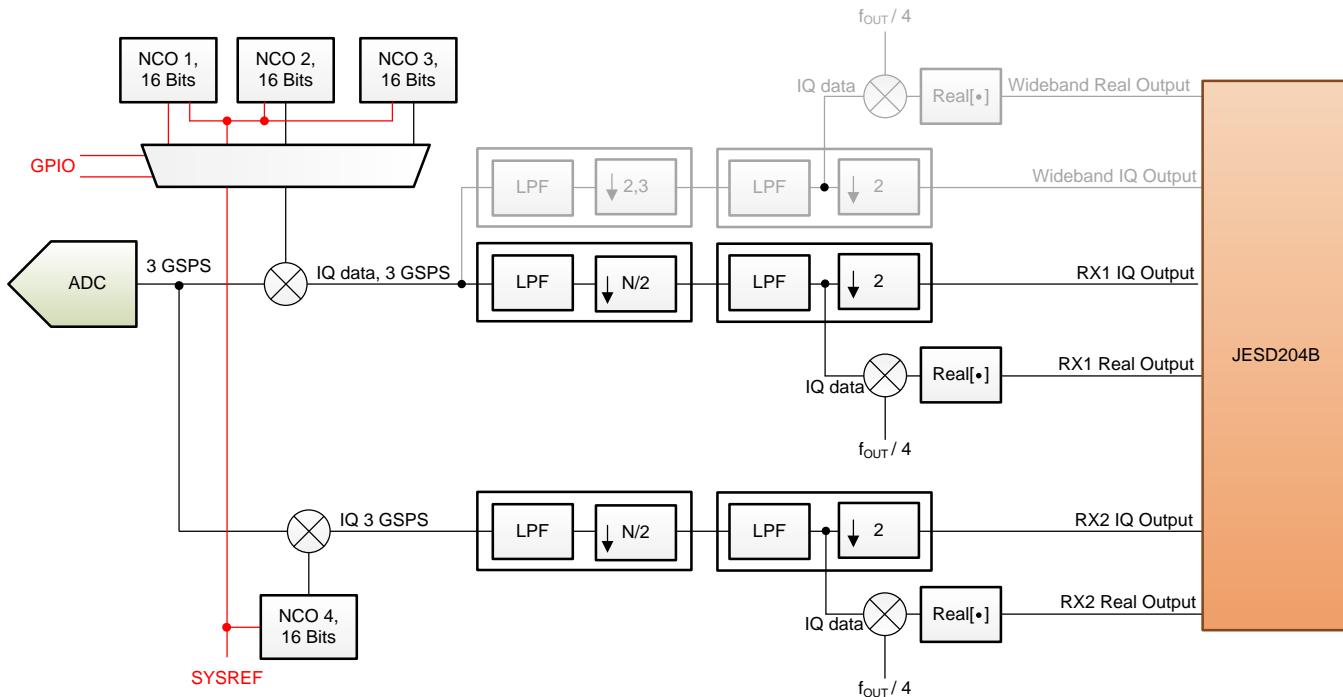

NOTE: Red traces show SYSREF going to the NCO blocks.

**Figure 93. DDC Chains Overview (One ADC Channel Shown)**

Additionally, the decimation filter block provides the option to convert the complex output back to real format at twice the decimated, complex output rate. The filter response with a real output is identical to a complex output. The band is centered in the middle of the Nyquist zone (mixed with  $f_{OUT} / 4$ ) based on a final output data rate of  $f_{OUT}$ .

#### 8.3.4.1 Operating Mode: Receiver

In receiver mode, the DDC block can be configured to single- or dual-band operation, as shown in Figure 94. Both DDC chains use the same decimation filter setting and the available options are discussed in the [Decimation Filters](#) section. The decimation filter setting also directly affects the interface rate and number of lanes of the JESD204B interface.

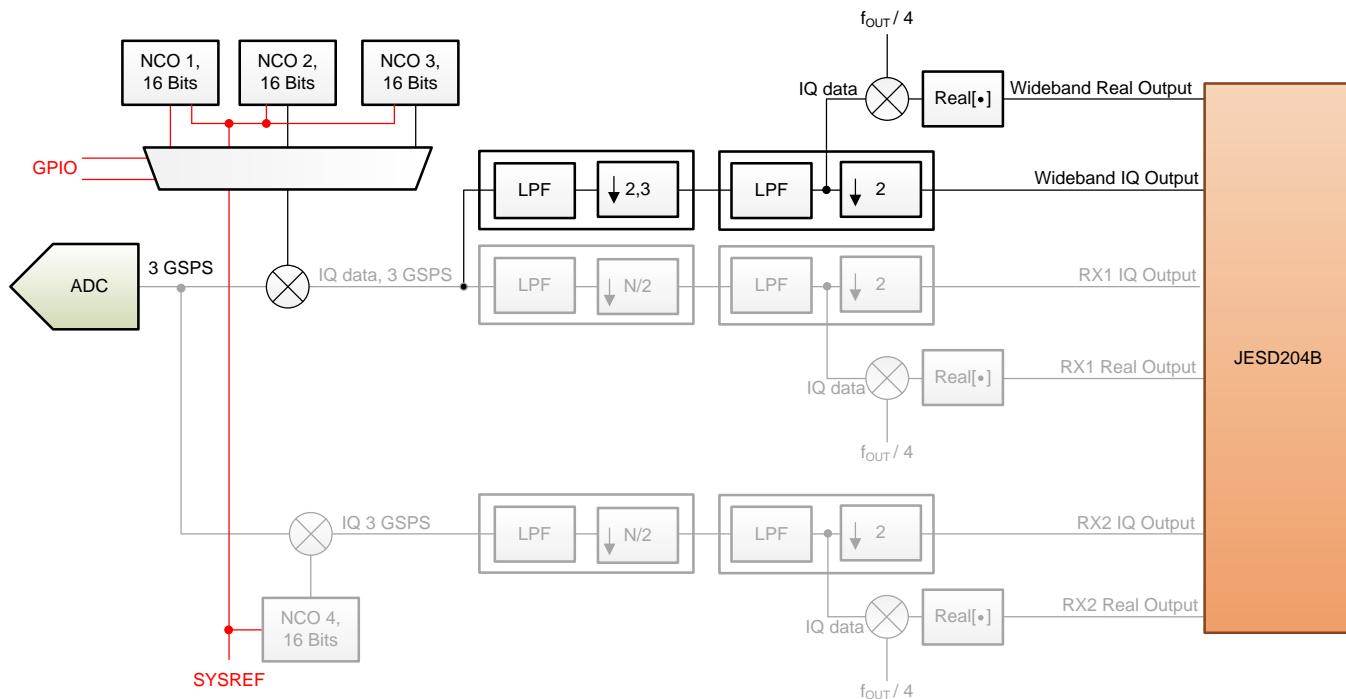

NOTE: Red traces show SYSREF going to the NCO blocks.

**Figure 94. Decimation Filter Option for Single- or Dual-Band Operation**

### 8.3.4.2 Operating Mode: Wide-Bandwidth Observation Receiver

This mode is intended for using a DDC with a wide bandwidth output, but for multiple bands. This mode uses a single DDC chain where up to three NCOs can be used to perform wide-bandwidth observation in a multi-band environment, as shown in [Figure 95](#). The three NCOs can be switched dynamically using either the GPIO pins or an SPI command. All three NCOs operate continuously to ensure phase continuity; however, when the NCO is switched, the output data are invalid until the decimation filters are completely flushed with data from the new band.

NOTE: Red traces show SYSREF going to the NCO blocks.

**Figure 95. Decimation Filter Implementation for Single-Band and Wide-Bandwidth Mode**

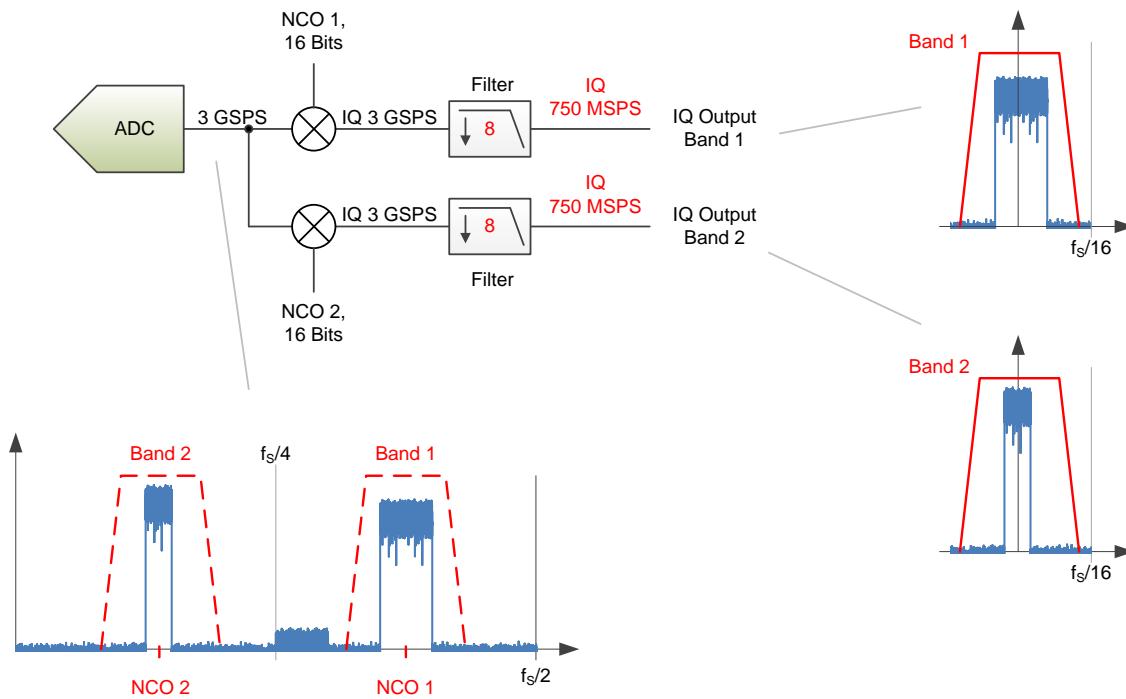

### 8.3.4.3 Decimation Filters

The stop-band rejection of the decimation filters is approximately 90 dB with a pass-band bandwidth of approximately 80%. [Table 4](#) gives an overview of the pass-band bandwidth depending on decimation filter setting and ADC sampling rate.

**Table 4. Decimation Filter Summary and Maximum Available Output Bandwidth**

DECIMATION SETTING	NO. OF DDCS AVAILABLE PER CHANNEL	NOMINAL PASSBAND GAIN	BANDWIDTH		ADC SAMPLE RATE = N MSPS		ADC SAMPLE RATE = 3 GSPS	
			3 dB (%)	1 dB (%)	OUTPUT RATE (MSPS) PER BAND	OUTPUT BANDWIDTH (MHz) PER BAND	COMPLEX OUTPUT RATE (MSPS) PER BAND	OUTPUT BANDWIDTH (MHz) PER BAND
Divide-by-4 complex	1	-0.4 dB	90.9	86.8	N / 4 complex	0.4 × N / 2	750	600
Divide-by-6 complex	1	-0.65 dB	90.6	86.1	N / 6 complex	0.4 × N / 3	500	400
Divide-by-8 complex	2	-0.27 dB	91.0	86.8	N / 8 complex	0.4 × N / 4	375	300
Divide-by-9 complex	2	-0.45 dB	90.7	86.3	N / 9 complex	0.4 × N / 4.5	333.3	266.6
Divide-by-10 complex	2	-0.58 dB	90.7	86.3	N / 10 complex	0.4 × N / 5	300	240
Divide-by-12 complex	2	-0.55 dB	90.7	86.4	N / 12 complex	0.4 × N / 6	250	200
Divide-by-16 complex	2	-0.42 dB	90.8	86.4	N / 16 complex	0.4 × N / 8	187.5	150
Divide-by-18 complex	2	-0.83 dB	91.2	87.0	N / 18 complex	0.4 × N / 9	166.6	133
Divide-by-20 complex	2	-0.91 dB	91.2	87.0	N / 20 complex	0.4 × N / 10	150	120
Divide-by-24 complex	2	-0.95 dB	91.1	86.9	N / 24 complex	0.4 × N / 12	125	100
Divide-by-32 complex	2	-0.78 dB	91.1	86.8	N / 32 complex	0.4 × N / 16	93.75	75

A dual-band example with a divide-by-8 complex is shown in [Figure 96](#).

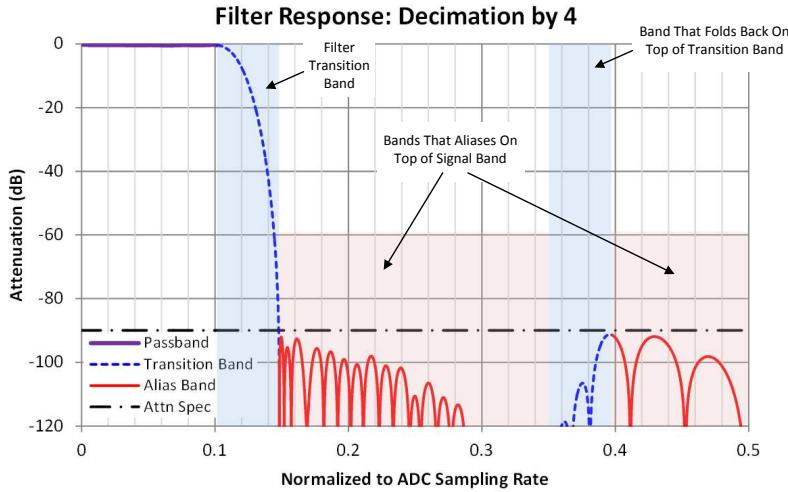

**Figure 96. Dual-Band Example**

The decimation filter responses normalized to the ADC sampling clock are illustrated in [Figure 96](#) to [Figure 119](#) and can be interpreted as follows:

Each figure contains the filter pass-band, transition bands, and alias bands, as shown in [Figure 97](#). The x-axis in [Figure 97](#) shows the offset frequency (after the NCO frequency shift) normalized to the ADC sampling clock frequency.

For example, in the divide-by-4 complex, the output data rate is an  $f_S / 4$  complex with a Nyquist zone of  $f_S / 8$  or  $0.125 \times f_S$ . The transition band is centered around  $0.125 \times f_S$  and the alias transition band is centered at  $0.375 \times f_S$ . The alias bands that alias on top of the wanted signal band are centered at  $0.25 \times f_S$  and  $0.5 \times f_S$  (and are colored in red).

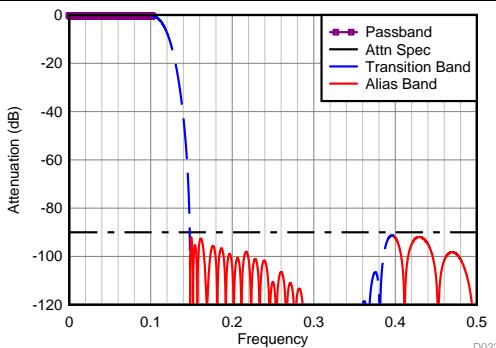

The decimation filters of the ADC32RF8x provide greater than 90-dB attenuation for the alias bands.

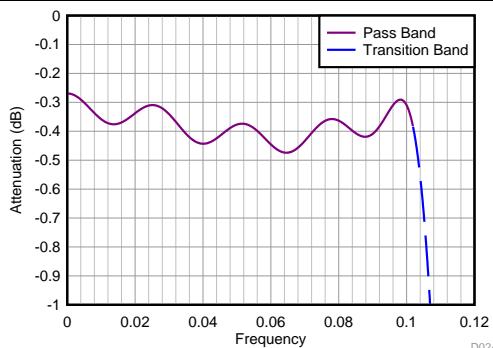

**Figure 97. Interpretation of the Decimation Filter Plots**

Peak-to-peak pass-band ripple: approximately 0.24 dB

**Figure 118. Divide-by-32 Filter Response**

**Figure 119. Divide-by-32 Filter Response (Zoomed)**

### 8.3.4.3.12 Latency with Decimation Options

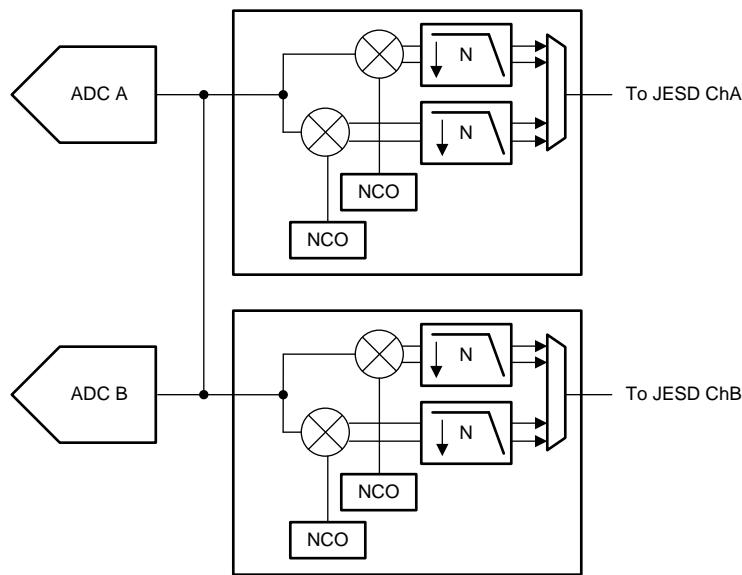

Device latency in 12-bit bypass mode (with LMFS = 8224) is 424 clock cycles. When the DDC option is used, latency increases as a result of decimation filters, as described in [Table 5](#).

**Table 5. Latency with different Decimation options**

DECIMATION OPTION	TOTAL LATENCY, DEVICE CLOCK CYCLES
Divide-by-4	516
Divide-by-6	746
Divide-by-8	621
Divide-by-9	763.5
Divide-by-10	811
Divide-by-12	897
Divide-by-16	1045
Divide-by-18	1164
Divide-by-20	1256
Divide-by-24	1443
Divide-by-32	1773

### 8.3.4.4 Digital Multiplexer (MUX)

The ADC32RF8x supports a mode where the output data of the ADC channel A can be routed internally to the digital blocks of both channel A and channel B. The ADC channel B can be powered down as shown in [Figure 120](#). In this manner, the ADC32RF8x can be configured as a single-channel ADC with up to four independent DDC chains or two wideband DDC chains. All decimation filters and JESD204B format configurations are identical to the two ADC channel operation.

**Figure 120. Digital Multiplexer Option**

### 8.3.4.5 Numerically-Controlled Oscillators (NCOs) and Mixers

The ADC32RF8x is equipped with three independent, complex NCOs per ADC channel. The oscillator generates a complex exponential sequence, as shown in [Equation 2](#).

$$x[n] = e^{-j\omega n}$$

where

- frequency ( $\omega$ ) is specified as a signed number by the 16-bit register setting
- (2)

The complex exponential sequence is multiplied by the real input from the ADC to mix the desired carrier down to 0 Hz.

Each ADC channel has two DDCs. The first DDC has three NCOs and the second DDC has one NCO. The first DDC can dynamically select one of the three NCOs based on the GPIO pin or SPI selection. In wide-bandwidth mode (lower decimation factors, for example, 4 and 6), there can only be one DDC for each ADC channel. The NCO frequencies can be programmed independently through the DDCx, NCO[4:1], and the MSB and LSB register settings.

The NCO frequency setting is set by the 16-bit register value given by [Equation 3](#):

$$f_{NCO} = \frac{DDCxNCOy \times f_S}{2^{16}}$$

where

- $x = 0, 1$
  - $y = 1 \text{ to } 4$
- (3)

For example:

If  $f_S = 2949.12 \text{ MSPS}$ , then the NCO register setting = 38230 (decimal).

Thus,  $f_{NCO}$  is defined by [Equation 4](#):

$$f_{NCO} = 38230 \times \frac{2949.12 \text{ MSPS}}{2^{16}} = 1720.35 \text{ MHz}$$
(4)

Any register setting changes that occur after the JESD204B interface is operational results in a non-deterministic NCO phase. If a deterministic phase is required, the JESD204B interface must be reinitialized after changing the register setting.

### 8.3.5 NCO Switching

The first DDC (DDC0) on each ADC channel provides three different NCOs that can be used for phase-coherent frequency hopping. This feature is available in both single-band and dual-band mode, but only affects DDC0.

The NCOs can be switched through an SPI control or by using the GPIO pins with the register configurations shown in [Table 6](#) for channel A (50xxh) and channel B (58Xxh). The assignment of which GPIO pin to use for INSEL0 and INSEL1 is done based on [Table 7](#), using registers 5438h and 5C38h. The NCO selection is done based on the logic selection on the GPIO pins; see [Table 8](#) and [Figure 121](#).

**Table 6. NCO Register Configurations**

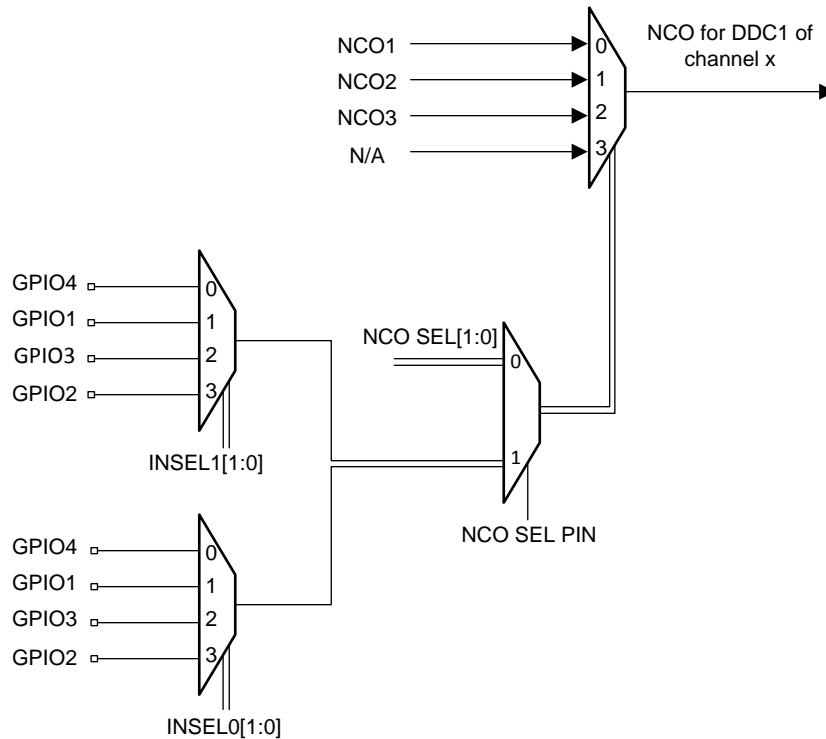

REGISTER	ADDRESS	DESCRIPTION
<b>NCO CONTROL THROUGH GPIO PINS</b>		
NCO SEL pin	500Fh, 580Fh	Selects the NCO control through the SPI (default) or a GPIO pin.
INSEL0, INSEL1	5438h, 5C38h	Selects which two GPIO pins are used to control the NCO.
<b>NCO CONTROL THROUGH SPI CONTROL</b>		
NCO SEL pin	500Fh, 580Fh	Selects the NCO control through the SPI (default) or a GPIO pin.
NCO SEL	5010h, 5810h	Selects which NCO to use for DDC0.

**Table 7. GPIO Pin Assignment**

INSELx[1:0] (Where x = 0 or 1)	GPIO PIN SELECTED
00	GPIO4
01	GPIO1
10	GPIO3
11	GPIO2

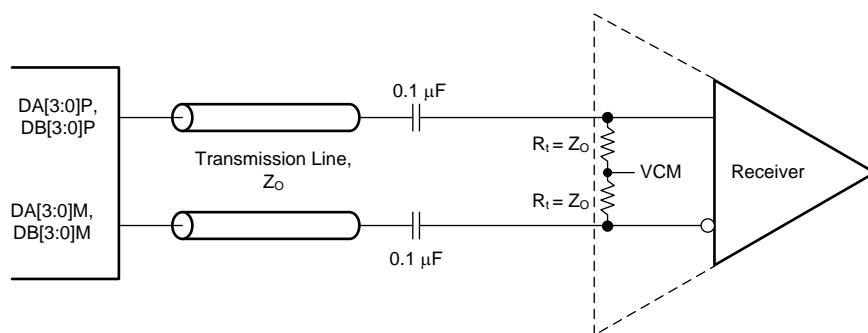

**Table 8. NCO Selection**

NCO SEL[1]	NCO SEL[0]	NCO SELECTED
0	0	NCO1
0	1	NCO2
1	0	NCO3
1	1	n/a

**Figure 121. NCO Switching from GPIO and SPI**

### 8.3.6 SerDes Transmitter Interface

Each 12.3-Gbps serializer, deserializer (SerDes) LVDS transmitter output requires ac-coupling between the transmitter and receiver. Terminate the differential pair with  $100\text{-}\Omega$  resistance (that is, two  $50\text{-}\Omega$  resistors) as close to the receiving device as possible to avoid unwanted reflections and signal degradation, as shown in Figure 122.

**Figure 122. External Serial JESD204B Interface Connection**

### 8.3.7 Eye Diagrams

[Figure 123](#) and [Figure 124](#) show the serial output eye diagrams of the ADC32RF8x at 5.0 Gbps and 12 Gbps against the JESD204B mask.

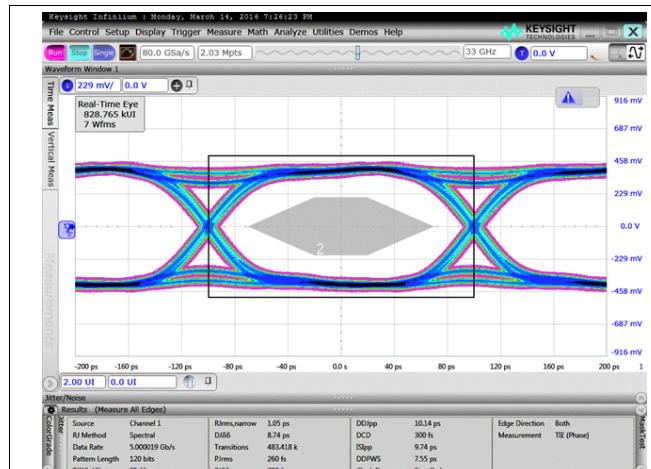

Figure 123. Data Eye at 5 Gbps

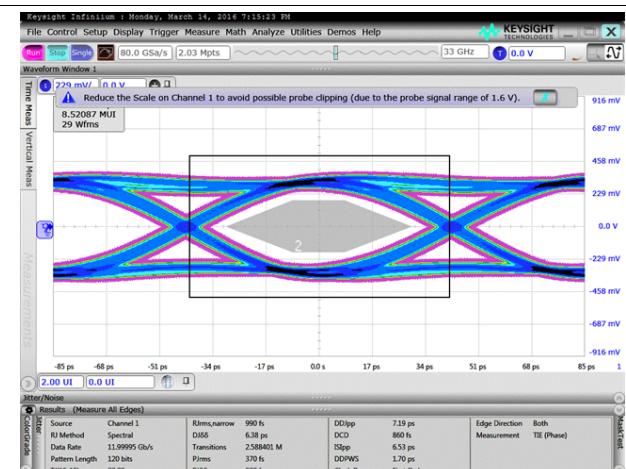

Figure 124. Data Eye at 12 Gbps

### 8.3.8 Alarm Outputs: Power Detectors for AGC Support

The GPIO pins can be configured as alarm outputs for channels A and B. The ADC32RF8x supports three different power detectors (an absolute peak power detector, crossing detector, and RMS power detector) as well as fast overrange from the ADC. The power detectors operate off the full-rate ADC output prior to the decimation filters.

#### 8.3.8.1 Absolute Peak Power Detector

In this detector mode, the peak is computed over eight samples of the ADC output. Next, the peak for a block of N samples ( $N \times S'$ ) is computed over a programmable block length and then compared against a threshold to either set or reset the peak detector output ([Figure 125](#) and [Figure 126](#)). There are two sets of thresholds and each set has two thresholds for hysteresis. The programmable DWELL-time counter is used for clearing the block detector alarm output.

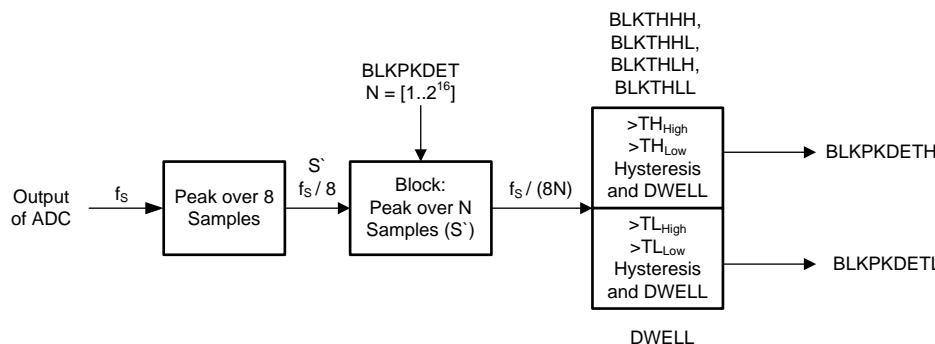

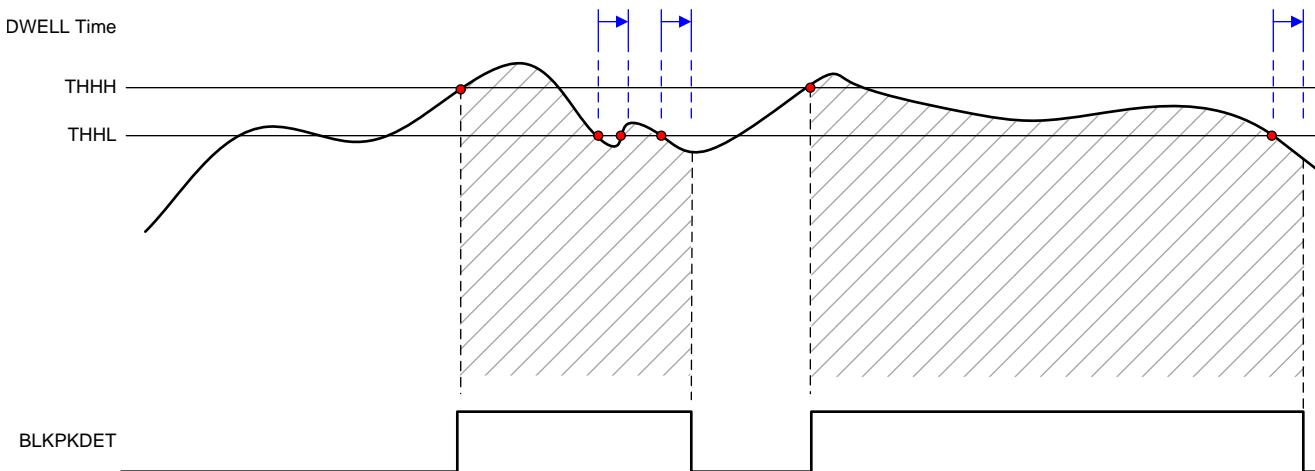

Figure 125. Peak Power Detector Implementation

**Figure 126. Peak Power Detector Timing Diagram**

**Table 9** shows the register configurations required to set up the absolute peak power detector. The detector operates in the  $f_S / 8$  clock domain; one peak sample is calculated over eight actual samples.

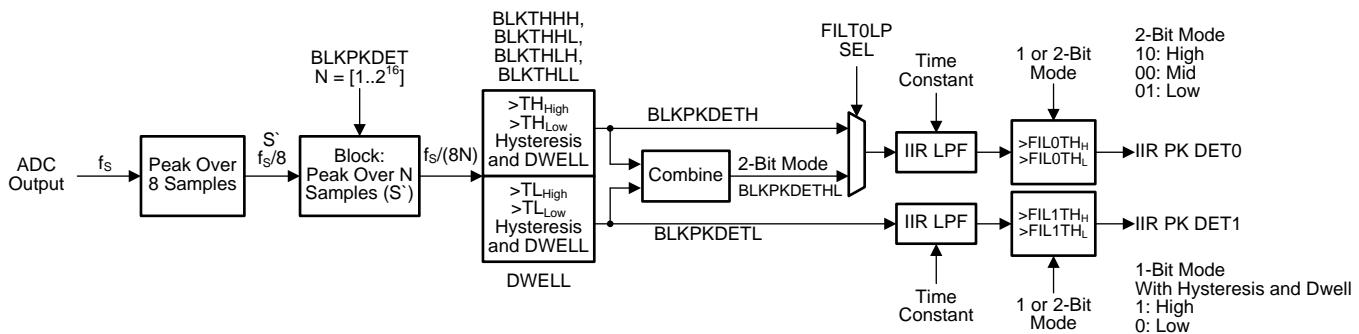

The automatic gain control (AGC) modes can be configured separately for channel A (54xxh) and channel B (5Cxhh), although some registers are common in 54xxh (such as the GPIO pin selection).

**Table 9. Registers Required for the Peak Power Detector**

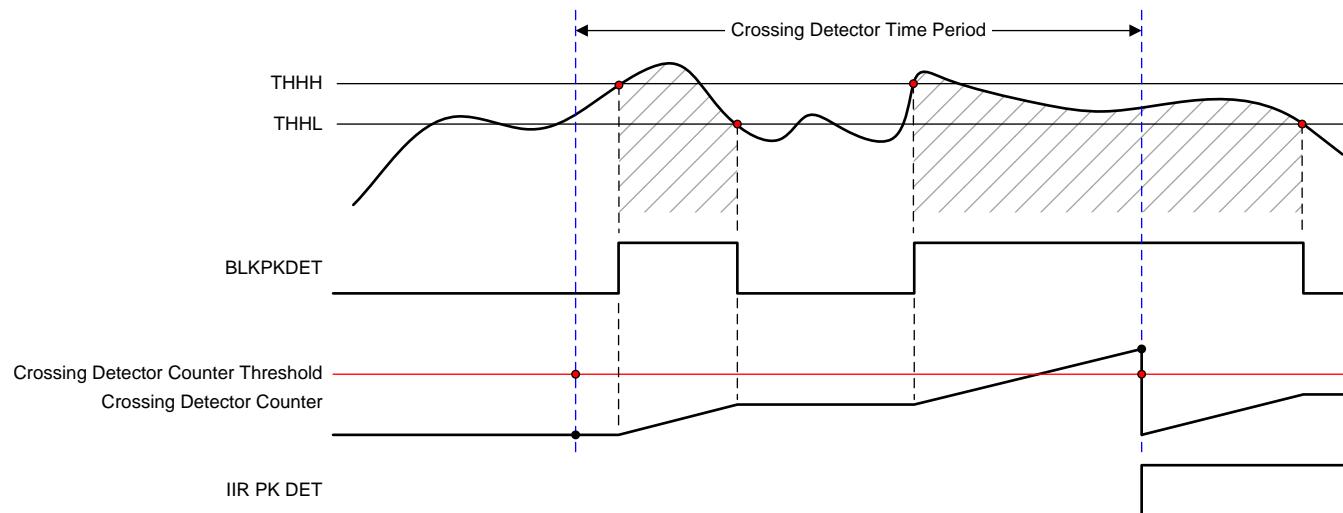

REGISTER	ADDRESS	DESCRIPTION
PKDET EN	5400, 5C00h	Enables peak detector
BLKPKDET	5401h, 5402h, 5403h, 5C01h, 5C02h, 5C03h	Sets the block length N of number of samples (S'). Number of actual ADC samples is 8X this value: N is 17 bits: 1 to $2^{16}$ .
BLKTHHH, BLKTHHL, BLKTHLH, BLKTHLL	5407h, 5408h, 5409h, 540Ah, 5C07h, 5C08h, 5C09h, 5C0Ah	Sets the different thresholds for the hysteresis function values from 0 to 256 (where 256 is equivalent to the peak amplitude). For example: if BLKTHHH is to $-2$ dBFS from peak, $10^{(-2/20)} \times 256 = 203$ , then set 5407h and 5C07h = CBh.
DWELL	540Bh, 540Ch, 5C0Bh, 5C0Ch	When the computed block peak crosses the upper thresholds BLKTHHH or BLKTHLH, the peak detector output flags are set. In order to be reset, the computed block peak must remain continuously lower than the lower threshold (BLKTHHL or BLKTHLL) for the period specified by the DWELL value. This threshold is 16 bits and is specified in terms of $f_S / 8$ clock cycles.
OUTSEL GPIO[4:1]	5432h, 5433h, 5434h, 5435h	Connects the BLKPKDETH, BLKPKDETL alarms to the GPIO pins; common register.
IODIR	5437h	Selects the direction for the four GPIO pins; common register.
RESET AGC	542Bh, 5C2Bh	After configuration, reset the AGC module to start operation.

### 8.3.8.2 Crossing Detector

In this detector mode the peak is computed over eight samples of the ADC output. Next, the peak for a block of N samples ( $N \times S'$ ) is computed over a programmable block length and then the peak is compared against two sets of programmable thresholds (with hysteresis). The crossing detector counts how many  $f_s / 8$  clock cycles that the block detector outputs are set high over a programmable time period and compares the counter value against the programmable thresholds. The alarm outputs are updated at the end of the time period, routed to the GPIO pins, and held in that state through the next cycle, as shown in [Figure 127](#) and [Figure 128](#). Alternatively, a 2-bit format can be used but (because the ADC32RF8x has four GPIO pins available) this feature uses all four pins for a single channel.

**Figure 127. Crossing Detector Implementation**

**Figure 128. Crossing Detector Timing Diagram**

**Table 10** shows the register configurations required to set up the crossing detector. The detector operates in the  $f_S / 8$  clock domain. The AGC modes can be configured separately for channel A (54xxh) and channel B (5Cxhh), although some registers are common in 54xxh (such as the GPIO pin selection).

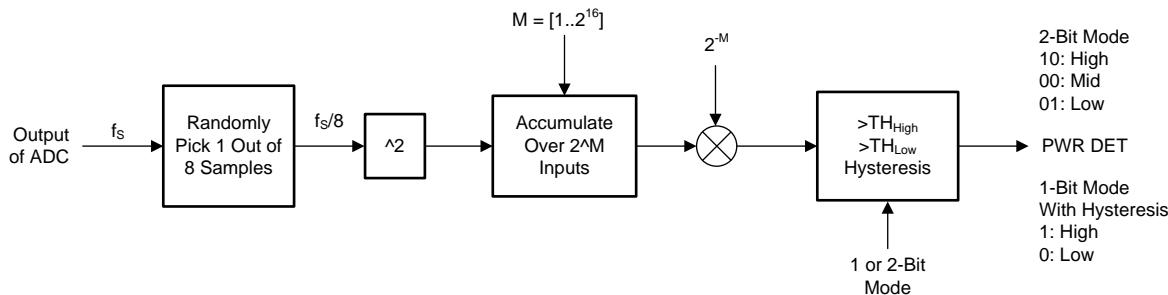

**Table 10. Registers Required for the Crossing Detector Operation**

REGISTER	ADDRESS	DESCRIPTION
PKDET EN	5400h, 5C00h	Enables peak detector
BLKPKDET	5401h, 5402h, 5403h, 5C01h, 5C02h, 5C03h	Sets the block length N of number of samples (S'). Number of actual ADC samples is 8X this value: N is 17 bits: 1 to $2^{16}$ .
BLKTHHH, BLKTHHL, BLKTLH, BLKTHLL	5407h, 5408h, 5409h, 540Ah, 5C07h, 5C08h, 5C09h, 5C0Ah	Sets the different thresholds for the hysteresis function values from 0 to 256 (where 256 is equivalent to the peak amplitude). For example: if BLKTHHH is to $-2$ dBFS from peak, $10^{(-2 / 20)} \times 256 = 203$ , then set 5407h and 5C07h = CBh.
FILT0LPSEL	540Dh, 5C0Dh	Select block detector output or 2-bit output mode as the input to the interrupt identification register (IIR) filter.
TIMECONST	540Eh, 540Fh, 5C0Eh, 5C0Fh	Sets the crossing detector time period for N = 0 to 15 as $2N \times f_S / 8$ clock cycles. The maximum time period is $32768 \times f_S / 8$ clock cycles (approximately 87 $\mu$ s at 3 GSPS).
FILOTHH, FILOTHL, FIL1THH, FIL1THL	540Fh-5412h, 5C0Fh-5C12h, 5416h-5419h, 5C16h-5C19h	Comparison thresholds for the crossing detector counter. These thresholds are 16-bit thresholds in 2.14-signed notation. A value of 1 (4000h) corresponds to 100% crossings, a value of 0.125 (0800h) corresponds to 12.5% crossings.
DWELLIIR	541Dh, 541Eh, 5C1Dh, 5C1Eh	DWELL counter for the IIR filter hysteresis.
IIR0 2BIT EN, IIR1 2BIT EN	5413h, 54114h, 5C13h, 5C114h	Enables 2-bit output format for the crossing detector.
OUTSEL GPIO[4:1]	5432h, 5433h, 5434h, 5435h	Connects the IIRPKDET0, IIRPKDET1 alarms to the GPIO pins; common register.
IODIR	5437h	Selects the direction for the four GPIO pins; common register.
RESET AGC	542Bh, 5C2Bh	After configuration, reset the AGC module to start operation.

### 8.3.8.3 RMS Power Detector

In this detector mode the peak power is computed for a block of N samples over a programmable block length and then compared against two sets of programmable thresholds (with hysteresis).

The RMS power detector circuit provides configuration options, as shown in [Figure 129](#). The RMS power value (1 or 2 bit) can be output onto the GPIO pins. In 2-bit output mode, two different thresholds are used whereas the 1-bit output provides one threshold together with hysteresis.

**Figure 129. RMS Power Detector Implementation**

[Table 11](#) shows the register configurations required to set up the RMS power detector. The detector operates in the  $f_S / 8$  clock domain. The AGC modes can be configured separately for channel A (54xxh) and channel B (5Cxhh), although some registers are common in 54xxh (such as the GPIO pin selection).

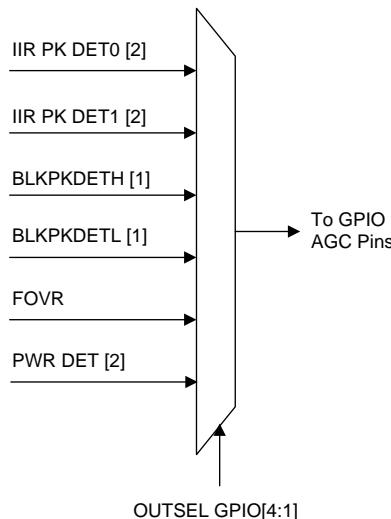

**Table 11. Registers Required for Using the RMS Power Detector Feature**

REGISTER	ADDRESS	DESCRIPTION
RMSDET EN	5420h, 5C20h	Enables RMS detector
PWRDETACCU	5421h, 5C21h	Programs the block length to be used for RMS power computation. The block length is defined in terms of $f_S / 8$ clocks. The block length can be programmed as $2^M$ with $M = 0$ to 16.
PWRDETH, PWRDETL	5422h, 5423h, 5424h, 5425h, 5C22h, 5C23h, 5C24h, 5C25h	The computed average power is compared against these high and low thresholds. One LSB of the thresholds represents $1 / 2^{16}$ . For example: if PWRDETH is set to -14 dBFS from peak, $[10^{(-14/20)}]^2 \times 2^{16} = 2609$ , then set 5422h, 5423h, 5C22h, 5C23h = 0A31h.
RMS2BIT EN	5427h, 5C27h	Enables 2-bit output format for the RMS detector output.
OUTSEL GPIO[4:1]	5432h, 5433h, 5434h, 5435h	Connects the PWRDET alarms to the GPIO pins; common register.
IODIR	5437h	Selects the direction for the four GPIO pins; common register.
RESET AGC	542Bh, 5C2Bh	After configuration, reset the AGC module to start operation.

### 8.3.8.4 GPIO AGC MUX

The GPIO pins can be used to control the NCO in wideband DDC mode or as alarm outputs for channel A and B. The GPIO pins can be configured through the SPI control to output the alarm from the peak power (1 bit), crossing detector (1 or 2 bit), faster overrange, or the RMS power output, as shown in [Figure 130](#).

The programmable output MUX allows connecting any signal (including the NCO control) to any of the four GPIO pins. These pins can be configured as outputs (AGC alarm) or inputs (NCO control) through SPI programming.

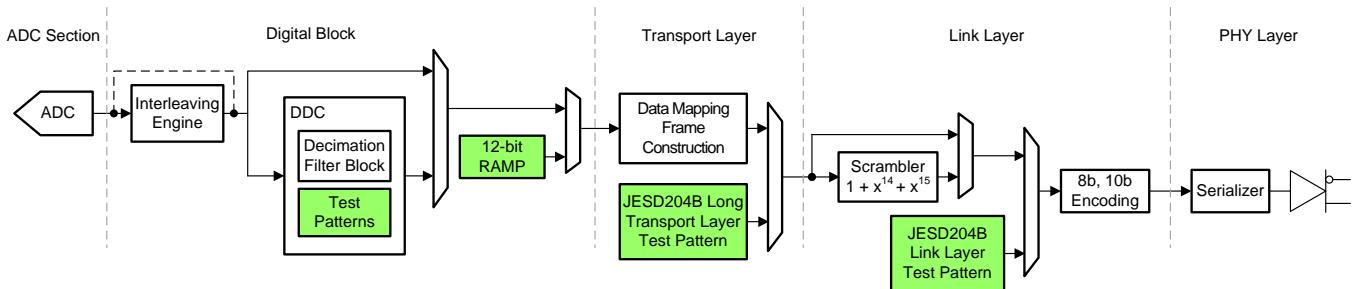

**Figure 130. GPIO Output MUX Implementation**

### 8.3.9 Power-Down Mode

The ADC32RF8x provides a lot of configurability for the power-down mode. Power-down can be enabled using the PDN pin or the SPI register writes.

### 8.3.10 ADC Test Pattern

The ADC32RF8x provides several different options to output test patterns instead of the actual output data of the ADC in order to simplify the serial interface and system debug of the JESD204B digital interface link. The output data path is shown in [Figure 131](#).

**Figure 131. Test Pattern Generator Implementation**

#### 8.3.10.1 Digital Block

The ADC test pattern replaces the actual output data of the ADC. The test patterns listed in [Table 12](#) are available when the DDC is enabled and located in register 37h of the decimation filter page. When programmed, the test patterns are output for each converter (M) stream. The number of converter streams per channel increases by 2 when complex (I, Q) output or dual-band DDC is selected. The test patterns can be synchronized for both ADC channels using the SYSREF signal.

Additionally, a 12-bit test pattern is also available.

**NOTE**

The number of converters increases in dual-band DDC mode and with a complex output.

**Table 12. Test Pattern Options (Register 37h and 38h in Decimation Filter Page)**

BIT	NAME	DEFAULT	DESCRIPTION
Address 37h, 38h (bits 7-0)	TEST PATTERN DDC1 I- DATA, TEST PATTERN DDC1 Q- DATA, TEST PATTERN DDC2 I- DATA, TEST PATTERN DDC2 Q- DATA,	0000	Test pattern outputs onl and Q stream of channel A and B when DDC option is chosen. 0000 = Normal operation using ADC output data 0001 = Outputs all 0s 0010 = Outputs all 1s 0011 = Outputs toggle pattern: output data are an alternating sequence of 10101010101010 and 01010101010101 0100 = Output digital ramp: output data increment by one LSB every clock cycle from code 0 to 65535 0110 = Single pattern: output data are a custom pattern 1 (75h and 76h) 0111 Double pattern: output data alternate between custom pattern 1 and custom pattern 2 1000 = Deskew pattern: output data are AAAAh 1001 = SYNC pattern: output data are FFFFh

**8.3.10.2 Transport Layer**

The transport layer maps the ADC output data into 8-bit octets and constructs the JESD204B frames using the LMFS parameters. Tail bits or 0's are added when needed. Alternatively, the JESD204B long transport layer test pattern can be substituted instead of the ADC data with the JESD frame, as shown in [Table 13](#).

**Table 13. Transport Layer Test Mode EN (Register 01h)**

BIT	NAME	DEFAULT	DESCRIPTION
4	TESTMODE EN	0	Generates long transport layer test pattern mode according to section 5.1.6.3 of the JESD204B specification. 0 = Test mode disabled 1 = Test mode disabled

**8.3.10.3 Link Layer**

The link layer contains the scrambler and the 8b, 10b encoding of any data passed on from the transport layer. Additionally, the link layer also handles the initial lane alignment sequence that can be manually restarted.

The link layer test patterns are intended for testing the quality of the link (jitter testing and so forth). The test patterns do not pass through the 8b, 10b encoder and contain the options listed in [Table 14](#).

**Table 14. Link Layer Test Mode (Register 03h)**

BIT	NAME	DEFAULT	DESCRIPTION
7-5	LINK LAYER TESTMODE	000	Generates a pattern according to section 5.3.3.8.2 of the JESD204B document. 000 = Normal ADC data 001 = D21.5 (high-frequency jitter pattern) 010 = K28.5 (mixed-frequency jitter pattern) 011 = Repeat the initial lane alignment (generates a K28.5 character and repeats lane alignment sequences continuously) 100 = 12-octet random pattern (RPAT) jitter pattern

Furthermore, a  $2^{15}$  pseudo-random binary sequence (PRBS) can be enabled by setting up a custom test pattern (AAAH) in the ADC section and running AAAAh through the 8b, 10b encoder with scrambling enabled.

## 8.4 Device Functional Modes

### 8.4.1 Device Configuration

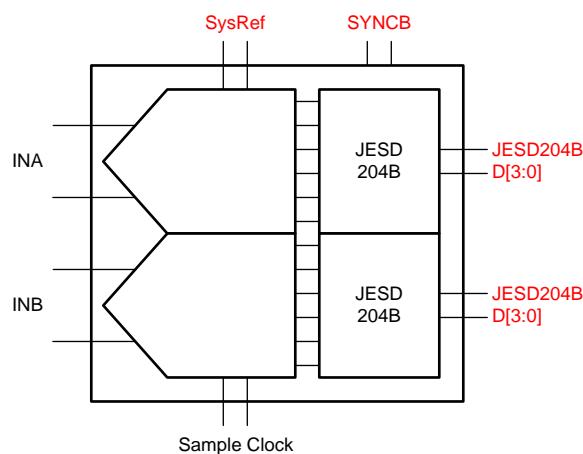

The ADC32RF8x can be configured using a serial programming interface, as described in the [Serial Interface](#) section. In addition, the device has one dedicated parallel pin (PDN) for controlling the power-down modes.

### 8.4.2 JESD204B Interface

The ADC32RF8x supports device subclass 1 with a maximum output data rate of 12.5 Gbps for each serial transmitter.

An external SYSREF signal is used to align all internal clock phases and the local multiframe clock to a specific sampling clock edge. This alignment allows synchronization of multiple devices in a system and minimizes timing and alignment uncertainty. The SYNCB input is used to control the JESD204B SerDes blocks, as shown in [Figure 132](#).

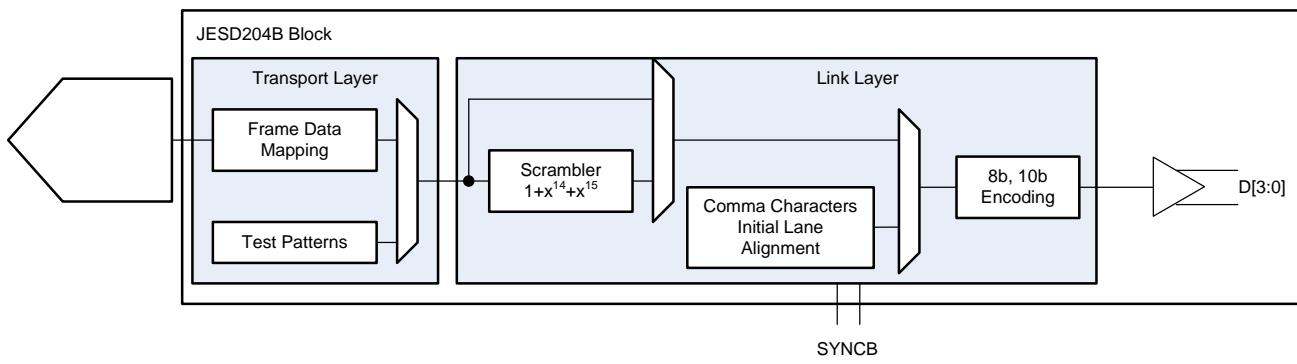

Depending on the ADC sampling rate, the JESD204B output interface can be operated with one, two, or four lanes per ADC channel. The JESD204B setup and configuration of the frame assembly parameters is controlled through the SPI interface.

Copyright © 2016, Texas Instruments Incorporated

**Figure 132. JESD Signal Overview**

The JESD204B transmitter block consists of the transport layer, the data scrambler, and the link layer, as shown in [Figure 133](#). The transport layer maps the ADC output data into the selected JESD204B frame data format and manages if the ADC output data or test patterns are transmitted. The link layer performs the 8b, 10b data encoding as well as the synchronization and initial lane alignment using the SYNC input signal. Optionally, data from the transport layer can be scrambled.

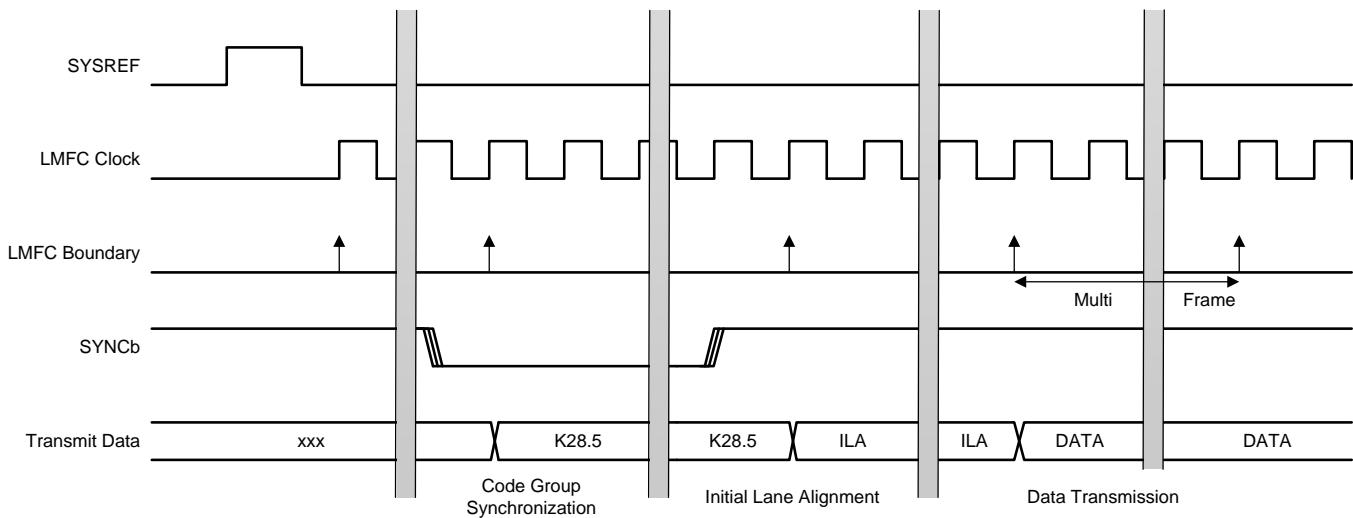

**Figure 133. JESD Digital Block Implementation**

## Device Functional Modes (continued)

### 8.4.2.1 JESD204B Initial Lane Alignment (ILA)

The receiving device starts the initial lane alignment process by deasserting the SYNCB signal. The SYNCB signal can be issued using the SYNCB input pins or by setting the proper SPI bits. When a logic low is detected on the SYNCB input, the ADC32RF8x starts transmitting comma (K28.5) characters to establish the code group synchronization, as shown in [Figure 134](#).

When synchronization completes, the receiving device reasserts the SYNCB signal and the ADC32RF8x starts the initial lane alignment sequence with the next local multiframe clock boundary. The ADC32RF8x transmits four multiframe, each containing K frames (K is SPI programmable). Each of the multiframe contains the frame start and end symbols. The second multiframe also contains the JESD204 link configuration data.

**Figure 134. JESD Internal Timing Information**

### 8.4.2.2 JESD204B Frame Assembly

The JESD204B standard defines the following parameters:

- F is the number of octets per frame clock period
- L is the number of lanes per link
- M is the number of converters for the device
- S is the number of samples per frame

## Device Functional Modes (continued)

### 8.4.2.3 JESD204B Frame Assembly with Decimation (Single-Band DDC): Complex Output

**Table 15** lists the available JESD204B interface formats and valid ranges for the ADC32RF8x with decimation (single-band DDC) when using a complex output format. The ranges are limited by the SerDes line rate and the maximum ADC sample frequency. The sample alignment on the different lanes is shown in [Table 16](#).

**Table 15. JESD Mode Options: Single-Band Complex Output**

DECIMATION SETTING (Complex)	NUMBER OF ACTIVE DDCS	L	M	F	S	PLL MODE	JESD MODE0	JESD MODE1	JESD MODE2	RATIO [f <sub>SerDes</sub> / f <sub>CLK</sub> (Gbps / GSPS)]

#### 8.4.2.7 JESD204B Frame Assembly with Decimation (Dual-Band DDC): Real Output

**Table 23** lists the available JESD204B formats and valid ranges for the ADC32RF8x with decimation (dual-band DDC) when using real output format. The ranges are limited by the SerDes line rate and the maximum ADC sample frequency. The sample alignment on the different lanes is shown in [Table 24](#).

**Table 23. JESD Mode Options: Dual-Band Real Output**

DECIMATION SETTING (Complex)	NUMBER OF ACTIVE DDCS	L	M	F	S	PLL MODE	JESD MODE0	JESD MODE1	JESD MODE2	RATIO [f <sub>SerDes</sub> / f <sub>CLK</sub> (Gbps / GSPS)]
Divide-by-8 (Divide-by-4 real)	2 per channel	8	4	1	1	20X	1	1	0	2.5

(1) Blue and green shading indicates the two bands for channel A; yellow and orange shading indicates the two bands for channel B.

### 8.4.3 Serial Interface

The ADC has a set of internal registers that can be accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock), and SDIN (serial interface data) pins. Serially shifting bits into the device is enabled when SEN is low. SDIN serial data are latched at every SCLK rising edge when SEN is active (low), as shown in [Figure 135](#). The interface can function with SCLK frequencies from 20 MHz down to low speeds (of a few hertz) and also with a non-50% SCLK duty cycle, as shown in [Table 25](#).

The SPI access uses 24 bits consisting of eight register data bits, 12 register address bits, and four special bits to distinguish between read/write, page and register, and individual channel access, as described in [Table 26](#).

**Figure 135. SPI Timing Diagram**

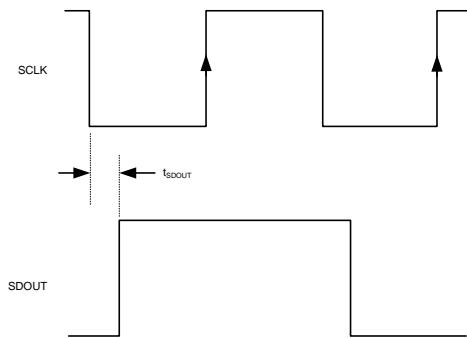

**Table 25. SPI Timing Information**

		MIN	TYP	MAX	UNIT
$f_{SCLK}$	SCLK frequency (equal to $1 / t_{SCLK}$ )	1		20	MHz
$t_{SLOADS}$	SEN to SCLK setup time	50			ns
$t_{SLOADH}$	SCLK to SEN hold time	50			ns
$t_{DSU}$	SDIN setup time	10			ns
$t_{DH}$	SDIN hold time	10			ns
$t_{SDOUT}$	Delay between SCLK falling edge to SDOUT		10		ns

**Table 26. SPI Input Description**

SPI BIT	DESCRIPTION	OPTIONS
R/W bit	Read/write bit	0 = SPI write 1 = SPI read back
M bit	SPI bank access	0 = Analog SPI bank (master) 1 = All digital SPI banks (main digital, interleaving, decimation filter, JESD digital, and so forth)
P bit	JESD page selection bit	0 = Page access 1 = Register access
CH bit	SPI access for a specific channel of the JESD SPI bank	0 = Channel A 1 = Channel B
ADDR[11:0]	SPI address bits	—
DATA[7:0]	SPI data bits	—

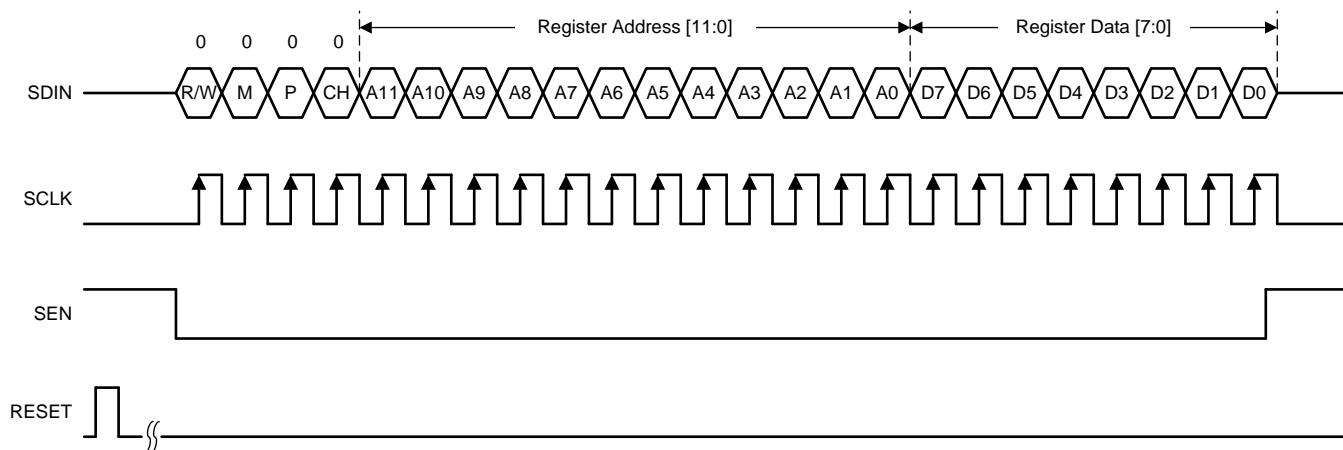

Figure 136 shows the SDOUT timing when data are read back from a register. Data are placed on the SDOUT bus at the SCLK falling edge so that the data can be latched at the SCLK rising edge by the external receiver.

**Figure 136. SDOUT Timing**

#### 8.4.3.1 Serial Register Write: Analog Bank

The internal register of the ADC32RF8x analog bank (Figure 137) can be programmed by:

1. Driving the SEN pin low.
2. Initiating a serial interface cycle selecting the page address of the register whose content must be written. To select the master page: write address 0012h with 04h. To select the ADC page: write address 0011h with FFh.
3. Writing the register content. When a page is selected, multiple registers located in the same page can be programmed.

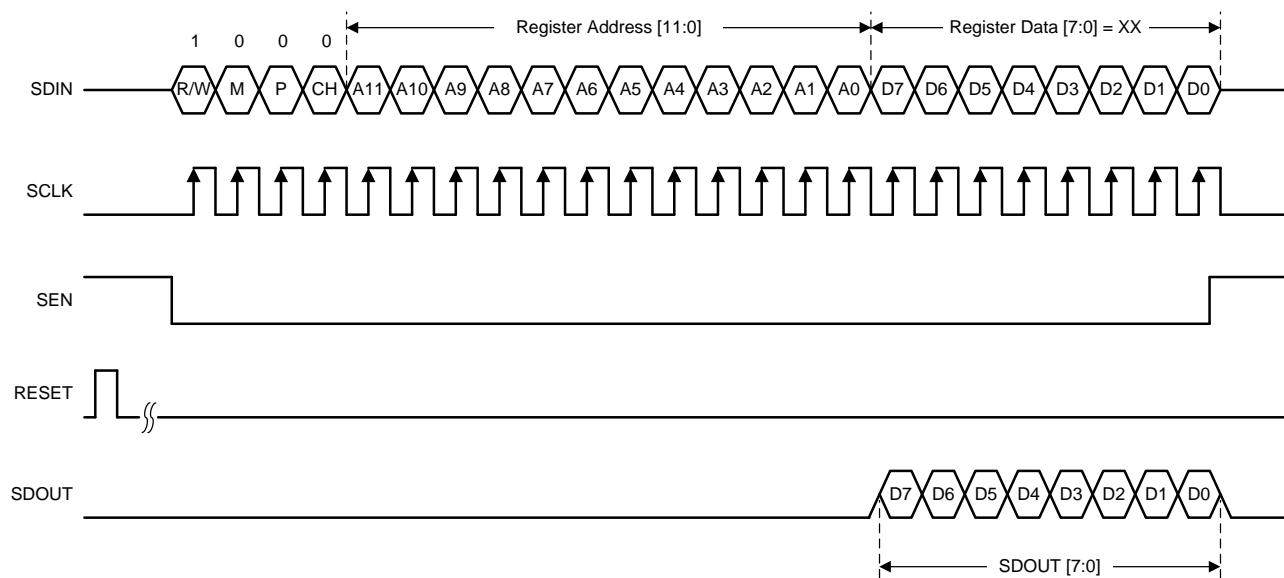

**Figure 137. SPI Write Timing Diagram for the Analog Bank**

#### 8.4.3.2 Serial Register Readout: Analog Bank

Contents of the registers located in the two pages of the analog bank (Figure 138) can be readback by:

1. Driving the SEN pin low.
2. Selecting the page address of the register whose content must be read. Master page: write address 0012h with 04h. ADC page: write address 0011h with FFh.
3. Setting the R/W bit to 1 and writing the address to be read back.
4. Reading back the register content on the SDOUT pin. When a page is selected, the contents of multiple registers located in same page can be readback.

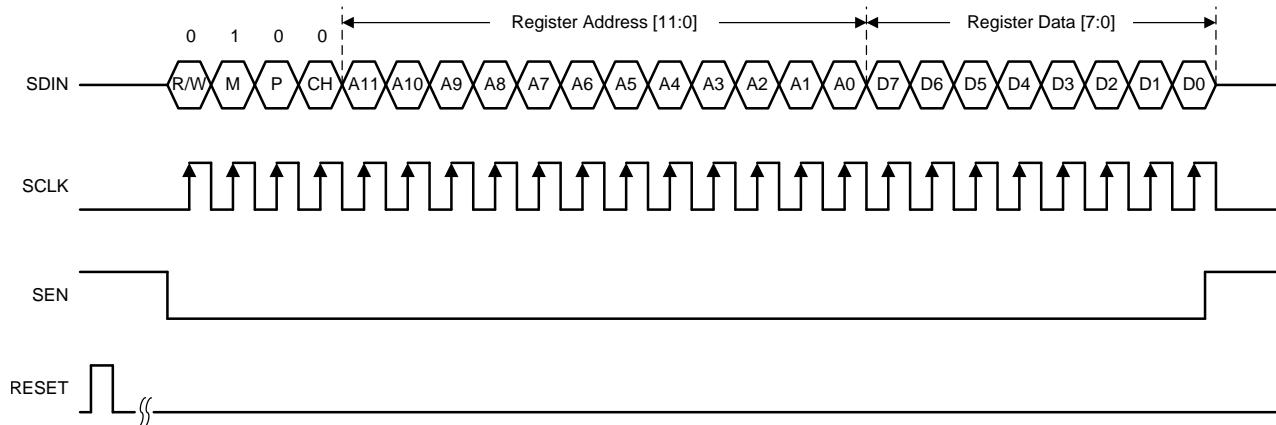

**Figure 138. SPI Read Timing Diagram for the Analog Bank**

### 8.4.3.3 Serial Register Write: Digital Bank

The digital bank contains seven pages (Offset Corrector Page for channel A and B; Digital Gain Page for channel A and B; Main digital Page for channel A and B; and JESD Digital Page). The timing for the individual page selection is shown in [Figure 139](#). The registers located in the pages of the digital bank can be programmed by:

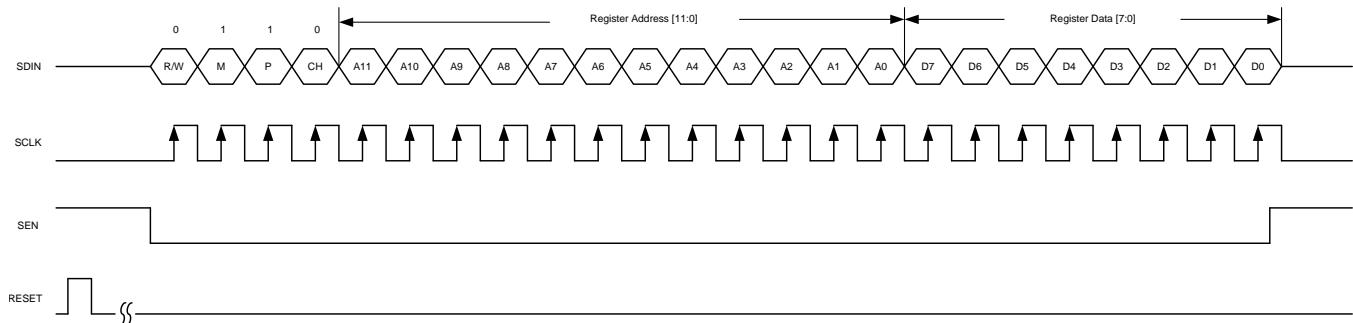

1. Driving the SEN pin low.
2. Setting the M bit to 1 and specifying the page with with the desired register. There are seven pages in Digital Bank. These pages can be selected by appropriately programming register bits DIGITAL BANK PAGE SEL, located in addresses 002h, 003h, and 004h, using three consecutive SPI cycles. Addressing in a SPI cycle begins with 4xxx when selecting a page from digital bank because the M bit must be set to 1.
  - To select the offset corrector page channel A: write address 4004h with 61h, 4003h with 00h, and 4002h with 00h.
  - To select the offset corrector page channel B: write address 4004h with 61h, 4003h with 01h, and 4002h with 00h.
  - To select the digital gain page channel A: write address 4004h with 61h, 4003h with 00h, and 4002h with 05h.
  - To select the digital gain page channel B: write address 4004h with 61h, 4003h with 01h, and 4002h with 05h.
  - To select the main digital page channel A: write address 4004h with 68h, 4003h with 00h, and 4002h with 00h.
  - To select the main digital page channel B: write address 4004h with 68h, 4003h with 01h, and 4002h with 00h.
  - To select the JESD digital page: write address 4004h with 69h, 4003h with 00h, and 4002h with 00h.

**Figure 139. SPI Write Timing Diagram for Digital Bank Page Selection**

3. Writing into the desired register by setting both the M bit and P bit to 1. Write register content. When a page is selected, multiple writes into the same page can be done. Addressing in an SPI cycle begins with 6xxx when selecting a page from the digital bank because the M bit must be set to 1, as shown in [Figure 140](#).

Note that the JESD digital page is common for both channels. The CH bit can be used to distinguish between two channels when programming registers in the JESD digital page. When CH = 0, registers are programmed for channel B; when CH = 1, registers are programmed for channel A. Thus, an SPI cycle to program registers for channel B begins with 6xxx and channel A begins with 7xxx.

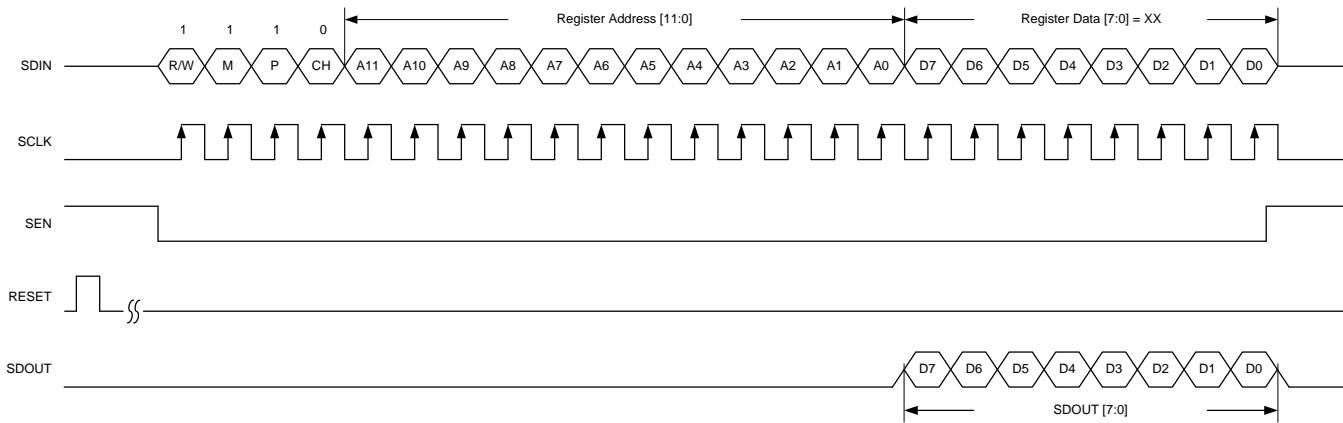

**Figure 140. SPI Write Timing Diagram for Digital Bank Register Write**

#### 8.4.3.4 Serial Register Readout: Digital Bank

Readback of the register in one of the digital banks (as shown in Figure 141) can be accomplished by:

1. Driving the SEN pin low.
2. Selecting the page in the digital page: follow step 2 in the [Serial Register Write: Digital Bank](#) section.
3. Set the R/W, M, and P bits to 1, select channel A or channel B, and write the address to be read back.
  - JESD digital page: use the CH bit to select channel B (CH = 0) or channel A (CH = 1).
4. Read back the register content on the SDOUT pin. When a page is selected, multiple read backs from the same page can be done.

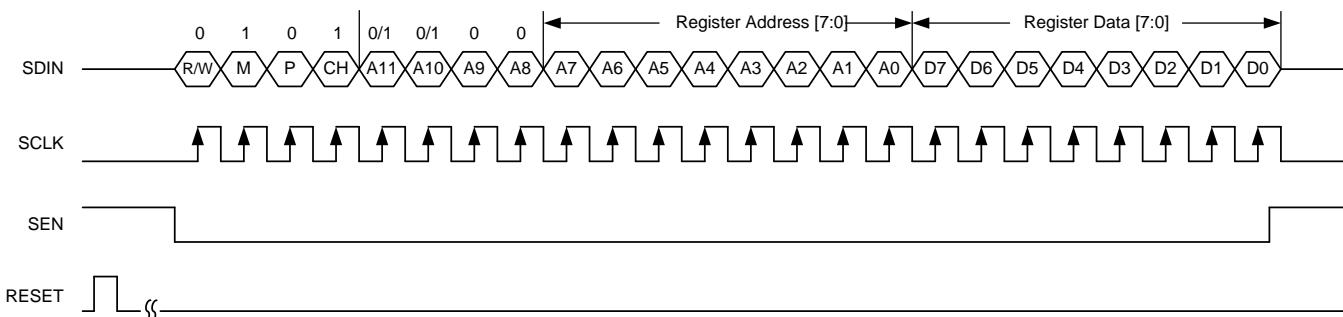

**Figure 141. SPI Read Timing Diagram for the Digital Bank**

#### 8.4.3.5 Serial Register Write: Decimation Filter and Power Detector Pages

The decimation filter and power detector pages are special pages that accept direct addressing. The sampling clock and SYSREF signal are required to properly configure the decimation settings. Registers located in these pages can be programmed in one SPI cycle (Figure 142).

1. Drive the SEN pin low.
2. Directly write to the decimation filter or power detector pages. To program registers in these pages, set M = 1 and CH = 1. Additionally, address bit A[10] selects the decimation filter page (A[10] = 0) or the power detector page (A[10] = 1). Address bit A[11] selects channel A (A[11] = 0) or channel B (A[11] = 1).
  - Decimation filter page: write address 50xxh for channel A or 58xxh for channel B.
  - Power detector page: write address 54xxh for channel A or 5Cxhh for channel B.

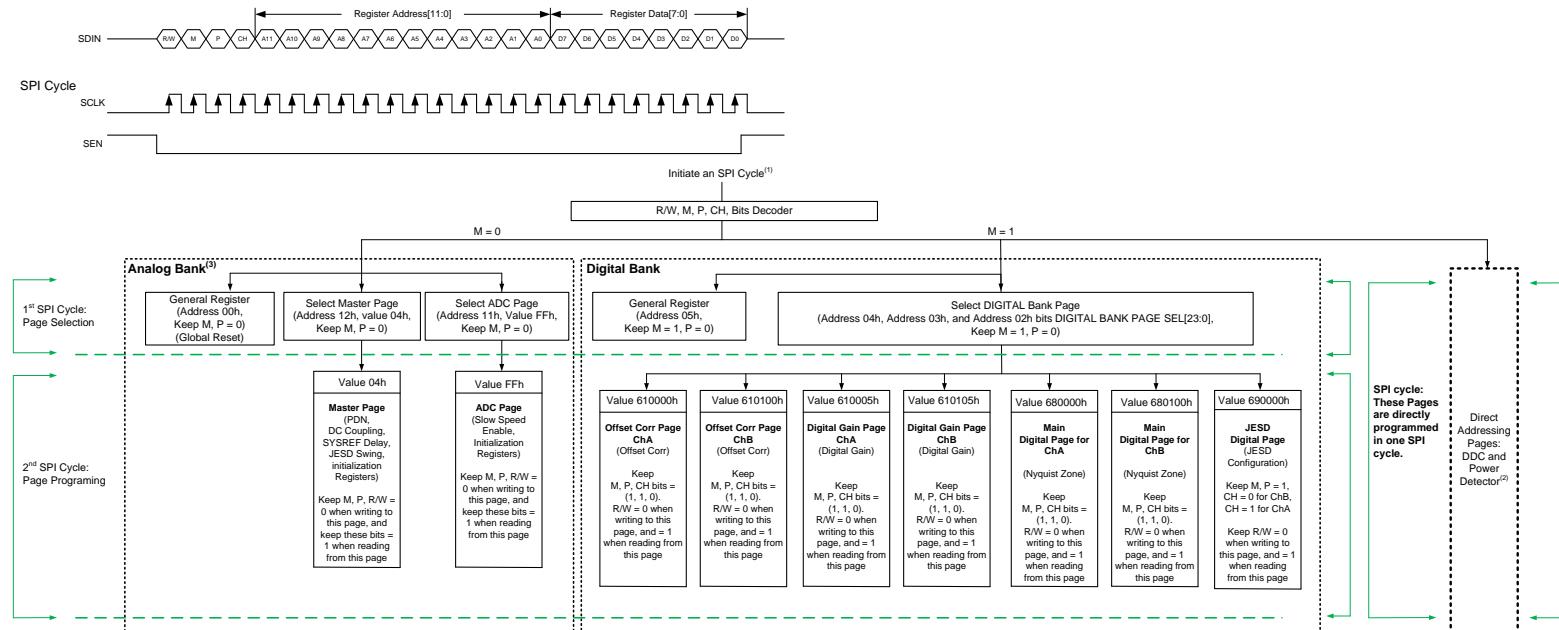

Example: Writing address 5001h with 02h selects the decimation filter page for channel A and programs decimation factor of divide-by-8 (complex output).

**Figure 142. SPI Write Timing Diagram for the Decimation and Power Detector Pages**

## 8.5 Register Maps

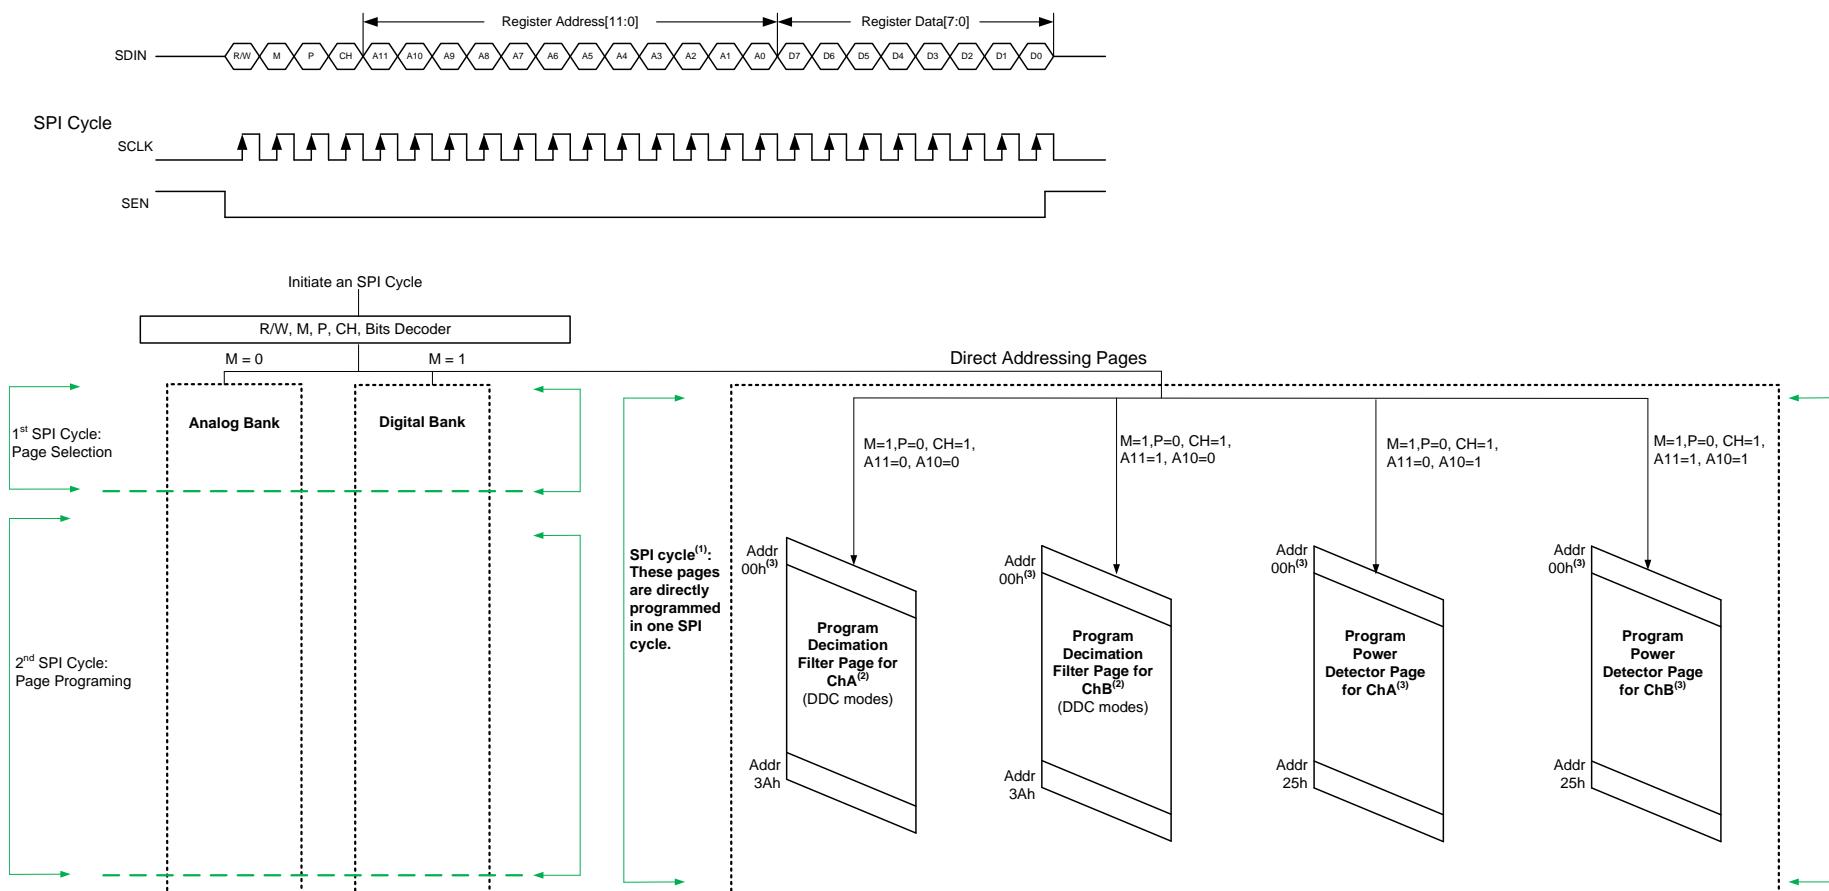

The ADC32RF8x contains two main SPI banks. The analog SPI bank provides access to the ADC core and the digital SPI bank controls the digital blocks (including the serial JESD interface). [Figure 143](#) and [Figure 144](#) provide a conceptual view of the SPI registers inside the ADC32RF8x. The analog SPI bank contains the master and ADC pages. The digital SPI bank is divided into multiple pages (the main digital, digital gain, decimation filter, JESD digital, and power detector pages).

- (1) In general, SPI writes are completed in two steps. The first step is to access the necessary page. The second step is to program the desired register in that page. When a page is accessed, the registers in that page can be programmed multiple times.
- (2) Registers in the decimation filter page and the power detector page can be directly programmed in one SPI cycle.
- (3) The CH bit is a *don't care* bit and is recommended to be kept at 0.

**Figure 143. SPI Registers, Two-Step Addressing**

## Register Maps (continued)

- (1) Registers in the decimation filter page and the power detector page can be directly programmed in one SPI cycle.
- (2) To program registers in the decimation filter page, set M = 1, CH = 1, A[10] = 0, and A[11] = 0 or 1 for channel A or B. Addressing begins at 50xx for channel A and 58xx for channel B.
- (3) To program registers in power detector page, set M = 1, CH = 1, A[10] = 1, and A[11] = 0 or 1 for channel A or B. Addressing begins at 54xx for channel A and 5Cxx for channel B.

**Figure 144. SPI Registers: Direct Addressing**

## Register Maps (continued)

Table 27 lists the register map for the ADC32RF8x.

### 8.5.1 Example Register Writes

This section provides three different example register writes. [Table 28](#) describes a global power-down register write, [Table 29](#) describes the register writes when the scrambler is enabled, and [Table 30](#) describes the register writes for 8X decimation for channels A and B (complex output, 1 DDC mode) with the NCO set to 1.8 GHz ( $f_S = 3$  GSPS) and the JESD format configured to LMFS = 4421.

**Table 28. Global Power-Down**

ADDRESS	DATA	COMMENT
12h	04h	Set the master page
20h	01h	Set the global power-down

**Table 29. Scrambler Enable**

ADDRESS	DATA	COMMENT
4004h	69h	Select the digital JESD page
4003h	00h	
6006h	80h	Scrambler enable, channel A
7006h	80h	Scrambler enable, channel B

**Table 30. 8X Decimation for Channel A and B**

ADDRESS	DATA	COMMENT
4004h	68h	Select the main digital page for channel A
4003h	00h	
6000h	01h	Issue a digital reset for channel A
6000h	00h	Clear the digital for reset channel A
4003h	01h	Select the main digital page for channel B
6000h	01h	Issue a digital reset for channel B
6000h	00h	Clear the digital reset for channel B
4004h	69h	Select the digital JESD page
4003h	00h	
6002h	01h	Set JESD MODE0 = 1, channel A
7002h	01h	Set JESD MODE0 = 1, channel B
5000h	01h	Enable the DDC, channel A
5001h	02h	Set decimation to 8X complex
5007h	9Ah	Set the LSB of DDC0, NCO1 to 9Ah ( $f_{NCO} = 1.8$ GHz, $f_S = 3$ GSPS)
5008h	99h	Set the MSB of DDC0, NCO1 to 99h ( $f_{NCO} = 1.8$ GHz, $f_S = 3$ GSPS)
5014h	01h	Enable the 6-dB digital gain of DDC0
5801h	02h	Set decimation to 8X complex
5807h	9Ah	Set the LSB of DDC0, NCO1 to 9Ah ( $f_{NCO} = 1.8$ GHz, $f_S = 3$ GSPS)
5808h	99h	Set the MSB of DDC0, NCO1 to 99h ( $f_{NCO} = 1.8$ GHz, $f_S = 3$ GSPS)
5814h	01h	Enable the 6-dB digital gain of DDC0

## 8.5.2 Register Descriptions

### 8.5.2.1 General Registers

#### 8.5.2.1.1 Register 000h (address = 000h), General Registers

**Figure 145. Register 000h**

7	6	5	4	3	2	1	0
RESET	0	0	0	0	0	0	RESET
R/W-0h	W-0h	W-0h	W-0h	W-0h	W-0h	W-0h	R/W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 31. Register 000h Field Descriptions**

Bit	Field	Type	Reset	Description
7	RESET	R/W	0h	0 = Normal operation 1 = Internal software reset, clears back to 0
6-1	0	W	0h	Must write 0
0	RESET	R/W	0h	0 = Normal operation <sup>(1)</sup> 1 = Internal software reset, clears back to 0

(1) Both bits (7, 0) must be set simultaneously to perform a reset.

#### 8.5.2.1.2 Register 002h (address = 002h), General Registers

**Figure 146. Register 002h**

7	6	5	4	3	2	1	0
DIGITAL BANK PAGE SEL[7:0]							
R/W-0h							

LEGEND: R/W = Read/Write; -n = value after reset

**Table 32. Register 002h Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	DIGITAL BANK PAGE SEL[7:0]	R/W	0h	Program the JESD BANK PAGE SEL[23:0] bits to access the desired page in the JESD bank. 680000h = Main digital page CHA selected 680100h = Main digital page CHB selected 610000h = Digital function page CHA selected 610100h = Digital function page CHB selected 690000h = JESD digital page selected

### 8.5.2.1.3 Register 003h (address = 003h), General Registers

**Figure 147. Register 003h**

7	6	5	4	3	2	1	0
DIGITAL BANK PAGE SEL[15:8]							
R/W-0h							

LEGEND: R/W = Read/Write; -n = value after reset

**Table 33. Register 003h Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	DIGITAL BANK PAGE SEL[15:8]	R/W	0h	Program the JESD BANK PAGE SEL[23:0] bits to access the desired page in the JESD bank. 680000h = Main digital page CHA selected 680100h = Main digital page CHB selected 610000h = Digital function page CHA selected 610100h = Digital function page CHB selected 690000h = JESD digital page selected

### 8.5.2.1.4 Register 004h (address = 004h), General Registers

**Figure 148. Register 004h**

7	6	5	4	3	2	1	0
DIGITAL BANK PAGE SEL[23:16]							
R/W-0h							

LEGEND: R/W = Read/Write; -n = value after reset

**Table 34. Register 004h Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	DIGITAL BANK PAGE SEL[23:16]	R/W	0h	Program the JESD BANK PAGE SEL[23:0] bits to access the desired page in the JESD bank. 680000h = Main digital page CHA selected 680100h = Main digital page CHB selected 610000h = Digital function page CHA selected 610100h = Digital function page CHB selected 690000h = JESD digital page selected

### 8.5.2.1.5 Register 010h (address = 010h), General Registers

**Figure 149. Register 010h**

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	3 or 4 WIRE
W-0h	R/W-0h						

LEGEND: R/W = Read/Write; W = Write; -n = value after reset

**Table 35. Register 010h Field Descriptions**

Bit	Field	Type	Reset	Description
7-1	0	W	0h	Must write 0
0	3 or 4 WIRE	R/W	0h	0 = 4-wire SPI (default) 1 = 3-wire SPI where SDIN become input or output

### 8.5.2.1.6 Register 011h (address = 011h), General Registers

**Figure 150. Register 011h**

7	6	5	4	3	2	1	0
ADC PAGE SEL							
R/W-0h							

LEGEND: R/W = Read/Write; -n = value after reset

**Table 36. Register 011h Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	ADC PAGE SEL	R/W	0h	00000000 = Normal operation, ADC page is not selected 11111111 = ADC page is selected; MASTER PAGE SEL must be set to 0

### 8.5.2.1.7 Register 012h (address = 012h), General Registers

**Figure 151. Register 012h**

7	6	5	4	3	2	1	0
0	0	0	0	0	MASTER PAGE SEL	0	0
W-0h	W-0h	W-0h	W-0h	W-0h	R/W-0h	W-0h	W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 37. Register 012h Field Descriptions**

Bit	Field	Type	Reset	Description
7-3	0	W	0h	Must write 0
2	MASTER PAGE SEL	R/W	0h	0 = Normal operation 1 = Selects the master page address; ADC PAGE must be set to 0
1-0	0	W	0h	Must write 0

### 8.5.3 Master Page ( $M = 0$ )

#### 8.5.3.1 Register 020h (address = 020h), Master Page

**Figure 152. Register 020h**

7	6	5	4	3	2	1	0
0	0	0	PDN SYSREF	0	0	PDN CHB	GLOBAL PDN
W-0h	W-0h	W-0h	R/W-0h	W-0h	R/W-0h	R/W-0h	R/W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 38. Register 020h Field Descriptions**

Bit	Field	Type	Reset	Description
7-5	0	W	0h	Must write 0
4	PDN SYSREF	R/W	0h	This bit powers down the SYSREF input buffer. 0 = Normal operation 1 = SYSREF input capture buffer is powered down and further SYSREF input pulses are ignored
3-2	0	W	0h	Must write 0
1	PDN CHB	R/W	0h	This bit powers down channel B. 0 = Normal operation 1 = Channel B is powered down
0	GLOBAL PDN	R/W	0h	This bit enables the global power-down. 0 = Normal operation 1 = Global power-down enabled

#### 8.5.3.2 Register 032h (address = 032h), Master Page

**Figure 153. Register 032h**

7	6	5	4	3	2	1	0
0	0	INCR CM IMPEDANCE	0	0	0	0	0
W-0h	W-0h	R/W-0h	W-0h	W-0h	W-0h	W-0h	W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 39. Register 032h Field Descriptions**

Bit	Field	Type	Reset	Description
7-6	0	W	0h	Must write 0
5	INCR CM IMPEDANCE	R/W	0h	Only use this bit when analog inputs are dc-coupled to the driver. 0 = VCM buffer directly drives the common point of biasing resistors. 1 = VCM buffer drives the common point of biasing resistors with > 5 kΩ
4-0	0	W	0h	Must write 0

### 8.5.3.3 Register 039h (address = 039h), Master Page

**Figure 154. Register 039h**

7	6	5	4	3	2	1	0
0	ALWAYS WRITE 1	0	ALWAYS WRITE 1	0	0	PDN CHB EN	SYNC TERM DIS
W-0h	W-0h	W-0h	W-0h	W-0h	R/W-0h	R/W-0h	R/W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 40. Register 039h Field Descriptions**

Bit	Field	Type	Reset	Description
7	0	W	0h	Must write 0
6	ALWAYS WRITE 1	W	0h	Always set this bit to 1
5	0	W	0h	Must write 0
4	ALWAYS WRITE 1	W	0h	Always set this bit to 1
3-2	0	W	0h	Must write 0
1	PDN CHB EN	R/W	0h	This bit enables the power-down control of channel B through the SPI in register 20h. 0 = PDN control disabled 1 = PDN control enabled
0	SYNC TERM DIS	R/W	0h	This bit disables the on-chip, 100-Ω termination resistors on the SYNCB input. 0 = On-chip, 100-Ω termination enabled 1 = On-chip, 100-Ω termination disabled

### 8.5.3.4 Register 03Ch (address = 03Ch), Master Page

**Figure 155. Register 03Ch**

7	6	5	4	3	2	1	0
0	SYSREF DEL EN	0	0	0	0	SYSREF DEL[4:3]	
W-0h	R/W-0h	W-0h	W-0h	W-0h	W-0h	R/W-0h	

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 41. Register 03Ch Field Descriptions**

Bit	Field	Type	Reset	Description
7	0	W	0h	Must write 0
6	SYSREF DEL EN	R/W	0h	This bit allows an internal delay to be added to the SYSREF input. 0 = SYSREF delay disabled 1 = SYSREF delay enabled through register settings [3Ch (bits 1-0), 5Ah (bits 7-5)]
5-2	0	W	0h	Must write 0
1-0	SYSREF DEL[4:3]	R/W	0h	When the SYSREF delay feature is enabled (3Ch, bit 6) the delay can be adjusted in 25-ps steps; the first step is 175 ps. The PVT variation of each 25-ps step is ±10 ps. The 175-ps step is ±50 ps; see <a href="#">Table 43</a> .

### 8.5.3.5 Register 05Ah (address = 05Ah), Master Page

**Figure 156. Register 05Ah**

7	6	5	4	3	2	1	0
	SYSREF DEL[2:0]		0	0	0	0	0
W-0h	R/W-0h	W-0h	W-0h	W-0h	W-0h	W-0h	W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 42. Register 05Ah Field Descriptions**

Bit	Field	Type	Reset	Description
7	SYSREF DEL2	W	0h	When the SYSREF delay feature is enabled (3Ch, bit 6) the delay can be adjusted in 25-ps steps; the first step is 175 ps. The PVT variation of each 25-ps step is ±10 ps. The 175-ps step is ±50 ps; see <a href="#">Table 43</a> .
6	SYSREF DEL1	R/W		
5	SYSREF DEL0	W		
4-0	0	W	0h	Must write 0

**Table 43. SYSREF DEL[2:0] Bit Settings**

STEP	SETTING	STEP (NOM)	TOTAL DELAY (NOM)
1	01000	175 ps	175 ps
2	00111	25 ps	200 ps
3	00110	25 ps	225 ps
4	00101	25 ps	250 ps
5	00100	25 ps	275 ps
6	00011	25 ps	300 ps

### 8.5.3.6 Register 03Dh (address = 3Dh), Master Page

**Figure 157. Register 03Dh**

7	6	5	4	3	2	1	0
0	0	0	0	0			JESD OUTPUT SWING
W-0h	W-0h	W-0h	W-0h	W-0h			R/W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 44. Register 03Dh Field Descriptions**

Bit	Field	Type	Reset	Description
7-3	0	W	0h	Must write 0
2-0	JESD OUTPUT SWING	R/W	0h	These bits select the output amplitude, $V_{OD}$ (mV <sub>PP</sub> ), of the JESD transmitter for all lanes. 0 = 860 mV <sub>PP</sub> 1 = 810 mV <sub>PP</sub> 2 = 770 mV <sub>PP</sub> 3 = 745 mV <sub>PP</sub> 4 = 960 mV <sub>PP</sub> 5 = 930 mV <sub>PP</sub> 6 = 905 mV <sub>PP</sub> 7 = 880 mV <sub>PP</sub>

### 8.5.3.7 Register 057h (address = 057h), Master Page

**Figure 158. Register 057h**

7	6	5	4	3	2	1	0
0	0	0	SEL SYSREF REG	ASSERT SYSREF REG	0	0	0
W-0h	W-0h	W-0h	R/W-0h	R/W-0h	W-0h	W-0h	W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 45. Register 057h Field Descriptions**

Bit	Field	Type	Reset	Description
7-5	0	W	0h	Must write 0
4	SEL SYSREF REG	R/W	0h	SYSREF can be asserted using this bit. Ensure that the SEL SYSREF REG register bit is set high before using this bit; see <a href="#">Using SYSREF</a> . 0 = SYSREF is logic low 1 = SYSREF is logic high
3	ASSERT SYSREF REG	R/W	0h	Set this bit to use the SPI register to assert SYSREF. 0 = SYSREF is asserted by device pins 1 = SYSREF can be asserted by the ASSERT SYSREF REG register bit Other bits = 0
2-0	0	W	0h	Must write 0

### 8.5.3.8 Register 058h (address = 058h), Master Page

**Figure 159. Register 058h**

7	6	5	4	3	2	1	0
0	0	SYNCB POL	0	0	0	0	0
W-0h	W-0h	R/W-0h	W-0h	W-0h	W-0h	W-0h	W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 46. Register 058h Field Descriptions**

Bit	Field	Type	Reset	Description
7-6	0	W	0h	Must write 0
5	SYNCB POL	R/W	0h	This bit inverts the SYNCB polarity. 0 = Polarity is not inverted; this setting matches the timing diagrams in this document and is the proper setting to use 1 = Polarity is inverted
4-0	0	W	0h	Must write 0

### 8.5.4 ADC Page (FFh, M = 0)

#### 8.5.4.1 Register 03Fh (address = 03Fh), ADC Page

**Figure 160. Register 03Fh**

7	6	5	4	3	2	1	0
0	0	0	0	0	SLOW SP EN1	0	0
W-0h	W-0h	W-0h	W-0h	W-0h	R/W-0h	W-0h	W-0h

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 47. Register 03Fh Field Descriptions**

Bit	Field	Type	Reset	Description
7-3	0	W	0h	Must write 0
2	SLOW SP EN1	R/W	0h	This bit must be enabled for clock rates below 2.5 GSPS. 0 = ADC sampling rates are faster than 2.5 GSPS 1 = ADC sampling rates are slower than 2.5 GSPS
1-0	0	W	0h	Must write 0

#### 8.5.4.2 Register 042h (address = 042h), ADC Page

**Figure 161. Register 042h**

7	6	5	4	3	2	1	0
0	0	0	SLOW SP EN2	0	0	0	0
W-0h	W-0h	W-0h	R/W-0h	W-0h	W-0h	W-0h	W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 48. Register 042h Field Descriptions**

Bit	Field	Type	Reset	Description
7-5	0	W	0h	Must write 0
4	SLOW SP EN2	R/W	0h	This bit must be enabled for clock rates below 2.5 GSPS. 0 = ADC sampling rates are faster than 2.5 GSPS 1 = ADC sampling rates are slower than 2.5 GSPS
3-0	0	W	0h	Must write 0

### 8.5.5 Digital Function Page (610000h, M = 1 for Channel A and 610100h, M = 1 for Channel B)

#### 8.5.5.1 Register 0A6h (address = 0A6h), Digital Function Page

**Figure 162. Register 0A6h**

7	6	5	4	3	2	1	0
0	0	0	0			DIG GAIN	
W-0h	W-0h	W-0h	W-0h			R/W-0h	

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 49. Register 0A6h Field Descriptions**

Bit	Field	Type	Reset	Description
7-4	0	W	0h	Must write 0
3-0	DIG GAIN	R/W	0h	These bits set the digital gain of the ADC output data prior to decimation up to 11 dB; see <a href="#">Table 50</a> .

**Table 50. DIG GAIN Bit Settings**

SETTING	DIGITAL GAIN
0000	0 dB
0001	1 dB
0010	2 dB
...	...
1010	10 dB
1011	11 dB

### 8.5.6 Offset Corr Page Channel A (610000h, M = 1)

#### 8.5.6.1 Register 034h (address = 034h), Offset Corr Page Channel A

**Figure 163. Register 034h**

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	SEL EXT EST
W-0h	R/W-0h						

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 51. Register 034h Field Descriptions**

Bit	Field	Type	Reset	Description
7-1	0	W	0h	Must write 0
0	SEL EXT EST	R/W	0h	This bit selects the external estimate for the offset correction block; see the <a href="#">Using DC Coupling in the ADC32RF8x</a> section.

### 8.5.6.2 Register 068h (address = 068h), Offset Corr Page Channel A

**Figure 164. Register 068h**

7	6	5	4	3	2	1	0
FREEZE OFFSET CORR	0	ALWAYS WRITE 1	0	0	DIS OFFSET CORR	ALWAYS WRITE 1	0
R/W-0h	W-0h	R/W-0h	W-0h	W-0h	R/W-0h	R/W-0h	R/W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 52. Register 068h Field Descriptions**

Bit	Field	Type	Reset	Description
7	FREEZE OFFSET CORR	R/W	0h	Use this bit and bits 5 and 1 to freeze the offset estimation process of the offset corrector; see the <a href="#">Using DC Coupling in the ADC32RF8x</a> section. 011 = Apply this setting after powering up the device 111 = Offset corrector is frozen, does not estimate offset anymore, and applies the last computed value. Others = Do not use
6	0	W	0h	Must write 0
5	ALWAYS WRITE 1	R/W	0h	Always write this bit as 1 for the offset correction block to work properly.
4-3	0	W	0h	Must write 0
2	DIS OFFSET CORR	R/W	0h	0 = Offset correction block works and removes $f_S / 8$ , $f_S / 4$ , $3f_S / 8$ , and $f_S / 2$ spurs 1 = Offset correction block is disabled
1	ALWAYS WRITE 1	R/W	0h	Always write this bit as 1 for the offset correction block to work properly.
0	0	W	0h	Must write 0

### 8.5.7 Offset Corr Page Channel B (610000h, M = 1)

#### 8.5.7.1 Register 068h (address = 068h), Offset Corr Page Channel B

**Figure 165. Register 068h**

7	6	5	4	3	2	1	0
FREEZE OFFSET CORR	0	ALWAYS WRITE 1	0	0	DIS OFFSET CORR	ALWAYS WRITE 1	0
R/W-0h	W-0h	R/W-0h	W-0h	W-0h	R/W-0h	R/W-0h	R/W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 53. Register 068h Field Descriptions**

Bit	Field	Type	Reset	Description
7,5,1	FREEZE OFFSET CORR	R/W	0h	Use this bit and bits 5 and 1 to freeze the offset estimation process of the offset corrector; see the <a href="#">Using DC Coupling in the ADC32RF8x</a> section. 011 = Apply this setting after powering up the device 111 = Offset corrector is frozen, does not estimate offset anymore, and applies the last computed value. Others = Do not use
6	0	W	0h	Must write 0
5	ALWAYS WRITE 1	R/W	0h	Always write this bit as 1 for the offset correction block to work properly.
4-3	0	W	0h	Must write 0
2	DIS OFFSET CORR	R/W	0h	0 = Offset correction block works and removes $f_S / 8$ , $f_S / 4$ , $3f_S / 8$ , and $f_S / 2$ spurs 1 = Offset correction block is disabled
1	ALWAYS WRITE 1	R/W	0h	Always write this bit as 1 for the offset correction block to work properly.
0	0	W	0h	Must write 0

### 8.5.8 Digital Gain Page (610005h, M = 1 for Channel A and 610105h, M = 1 for Channel B)

#### 8.5.8.1 Register 0A6h (address = 0A6h), Digital Gain Page

**Figure 166. Register 0A6h**

7	6	5	4	3	2	1	0
0	0	0	0				DIGITAL GAIN
W-0h	W-0h	W-0h	W-0h				R/W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 54. Register 0A6h Field Descriptions**

Bit	Field	Type	Reset	Description
7-4	0	W	0h	Must write 0
3-0	DIGITAL GAIN	R/W	0h	These bits apply a digital gain to the ADC data (before the DDC) up to 11 dB. 0000 = Default 0001 = 1 dB 1011 = 11 dB Others = Do not use

### 8.5.9 Main Digital Page Channel A (680000h, M = 1)

#### 8.5.9.1 Register 000h (address = 000h), Main Digital Page Channel A

**Figure 167. Register 000h**

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	DIG CORE RESET GBL
W-0h	R/W-0h						

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 55. Register 000h Field Descriptions**

Bit	Field	Type	Reset	Description
7-1	0	W	0h	Must write 0
0	DIG CORE RESET GBL	R/W	0h	Pulse this bit (0 → 1 → 0) to reset the digital core (applies to both channel A and B). All Nyquist zone settings take effect when this bit is pulsed.

### 8.5.9.2 Register 0A2h (address = 0A2h), Main Digital Page Channel A

**Figure 168. Register 0A2h**

7	6	5	4	3	2	1	0
0	0	0	0	NQ ZONE EN		NYQUIST ZONE	
W-0h	W-0h	W-0h	W-0h	R/W-0h		R/W-0h	

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 56. Register 0A2h Field Descriptions**

Bit	Field	Type	Reset	Description
7-4	0	W	0h	Must write 0
3	NQ ZONE EN	R/W	0h	This bit allows for specification of the operating Nyquist zone. 0 = Nyquist zone specification disabled 1 = Nyquist zone specification enabled
2-0	NYQUIST ZONE	R/W	0h	These bits specify the operating Nyquist zone for the analog correction loop. Set the NQ ZONE EN bit before programming these bits. For example, at a 3-GSPS chip clock, the first Nyquist zone is from dc to 1.5 GHz, the second Nyquist zone is from 1.5 GHz to 3 GHz, and so on. 000 = First Nyquist zone (dc – $f_S / 2$ ) 001 = Second Nyquist zone ( $f_S / 2 - f_S$ ) 010 = Third Nyquist zone 011 = Fourth Nyquist zone

### 8.5.10 Main Digital Page Channel B (680001h, M = 1)

#### 8.5.10.1 Register 000h (address = 000h), Main Digital Page Channel B

**Figure 169. Register 000h**

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	DIG CORE RESET GBL
W-0h	R/W-0h						

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 57. Register 000h Field Descriptions**

Bit	Field	Type	Reset	Description
7-1	0	W	0h	Must write 0
0	DIG CORE RESET GBL	R/W	0h	Pulse this bit (0 → 1 → 0) to reset the digital core (applies to both channel A and B). All Nyquist zone settings take effect when this bit is pulsed.

### 8.5.10.2 Register 0A2h (address = 0A2h), Main Digital Page Channel B

**Figure 170. Register 0A2h**

7	6	5	4	3	2	1	0
0	0	0	0	NQ ZONE EN		NYQUIST ZONE	
W-0h	W-0h	W-0h	W-0h	R/W-0h		R/W-0h	

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 58. Register 0A2h Field Descriptions**

Bit	Field	Type	Reset	Description
7-4	0	W	0h	Must write 0
3	NQ ZONE EN	R/W	0h	This bit allows for specification of the operating Nyquist zone. 0 = Nyquist zone specification disabled 1 = Nyquist zone specification enabled
2-0	NYQUIST ZONE	R/W	0h	These bits specify the operating Nyquist zone for the analog correction loop. Set the NQ ZONE EN bit before programming these bits. For example, at a 3-GSPS chip clock, first Nyquist zone is from dc to 1.5 GHz, the second Nyquist zone is from 1.5 GHz to 3 GHz, and so on. 000 = First Nyquist zone ( $dc - f_S / 2$ ) 001 = Second Nyquist zone ( $f_S / 2 - f_S$ ) 010 = Third Nyquist zone 011 = Fourth Nyquist zone

### 8.5.11 JESD Digital Page (6900h, M = 1)

#### 8.5.11.1 Register 001h (address = 001h), JESD Digital Page

**Figure 171. Register 001h**

7	6	5	4	3	2	1	0
CTRL K	0	0	TESTMODE EN	0	LANE ALIGN	FRAME ALIGN	TX LINK DIS
R/W-0h	W-0h	W-0h	R/W-0h	W-0h	R/W-0h	R/W-0h	R/W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 59. Register 001h Field Descriptions**

Bit	Field	Type	Reset	Description
7	CTRL K	R/W	0h	This bit is the enable bit for the number of frames per multiframe. 0 = Default is five frames per multiframe 1 = Frames per multiframe can be set in register 06h
6-5	0	R/W	0h	Must write 0
4	TESTMODE EN		0	This bit generates a long transport layer test pattern mode according to section 5.1.6.3 of the JESD204B specification. 0 = Test mode disabled 1 = Test mode enabled
3	0	W	0h	Must write 0
2	LANE ALIGN	R/W	0h	This bit inserts a lane alignment character (K28.3) for the receiver to align to the lane boundary per section 5.3.3.5 of the JESD204B specification. 0 = Normal operation 1 = Inserts lane alignment characters
1	FRAME ALIGN	R/W	0h	This bit inserts a frame alignment character (K28.7) for the receiver to align to the frame boundary per section 5.3.3.5 of the JESD204B specification. 0 = Normal operation 1 = Inserts frame alignment characters
0	TX LINK DIS	R/W	0h	This bit disables sending the initial link alignment (ILA) sequence when SYNC is deasserted. 0 = Normal operation 1 = ILA disabled

### 8.5.11.2 Register 002h (address = 002h ), JESD Digital Page

**Figure 172. Register 002h**

7	6	5	4	3	2	1	0
SYNC REG	SYNC REG EN	0	0	12BIT MODE		JESD MODE0	
R/W-0h	R/W-0h	W-0h	W-0h		R/W-0h		R/W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 60. Register 002h Field Descriptions**

Bit	Field	Type	Reset	Description
7	SYNC REG	R/W	0h	This bit provides SYNC control through the SPI. 0 = Normal operation 1 = ADC output data are replaced with K28.5 characters
6	SYNC REG EN	R/W	0h	This bit is the enable bit for SYNC control through the SPI. 0 = Normal operation 1 = SYNC control through the SPI is enabled (ignores the SYNCB input pins)
5-4	0	W	0h	Must write 0
3-2	12BIT MODE	R/W	0h	This bit enables the 12-bit output mode for more efficient data packing. 00 = Normal operation, 14-bit output 01, 10 = Unused 11 = High-efficient data packing enabled
1-0	JESD MODE0	R/W	0h	These bits select the configuration register to configure the correct LMFS frame assemblies for different decimation settings; see the JESD frame assembly tables in the <a href="#">JESD204B Frame Assembly</a> section. 00 = 0 01 = 1 10 = 2 11 = 3

### 8.5.11.3 Register 003h (address = 003h), JESD Digital Page

**Figure 173. Register 003h**

7	6	5	4	3	2	1	0
LINK LAYER TESTMODE	LINK LAY RPAT		LMFC MASK RESET	JESD MODE1	JESD MODE2	RAMP 12BIT	
R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-1h	R/W-0h	R/W-0h	R/W-0h

LEGEND: R/W = Read/Write; -n = value after reset

**Table 61. Register 003h Field Descriptions**

Bit	Field	Type	Reset	Description
7-5	LINK LAYER TESTMODE	R/W	0h	These bits generate a pattern according to section 5.3.3.8.2 of the JESD204B document. 000 = Normal ADC data 001 = D21.5 (high-frequency jitter pattern) 010 = K28.5 (mixed-frequency jitter pattern) 011 = Repeat initial lane alignment (generates a K28.5 character and repeats lane alignment sequences continuously) 100 = 12-octet RPAT jitter pattern
4	LINK LAY RPAT	R/W	0h	This bit changes the running disparity in a modified RPAT pattern test mode (only when link layer test mode = 100). 0 = Normal operation 1 = Changes disparity
3	LMFC MASK RESET	R/W	0h	0 = Normal operation
2	JESD MODE1	R/W	1h	These bits select the configuration register to configure the correct LMFS frame assemblies for different decimation settings; see the JESD frame assembly tables in the <a href="#">JESD204B Frame Assembly</a> section
1	JESD MODE2	R/W	0h	These bits select the configuration register to configure the correct LMFS frame assemblies for different decimation settings; see the JESD frame assembly tables in the <a href="#">JESD204B Frame Assembly</a> section
0	RAMP 12BIT	R/W	0h	12-bit RAMP test pattern. 0 = Normal data output 1 = Digital output is the RAMP pattern

### 8.5.11.4 Register 004h (address = 004h), JESD Digital Page

**Figure 174. Register 004h**

7	6	5	4	3	2	1	0
0	0	0	0	0	0	REL ILA SEQ	
W-0h	W-0h	W-0h	W-0h	W-0h	W-0h	R/W-0h	

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 62. Register 004h Field Descriptions**

Bit	Field	Type	Reset	Description
7-2	0	W	0h	Must write 0
1-0	REL ILA SEQ	R/W	0h	These bits delay the generation of the lane alignment sequence by 0, 1, 2, or 3 multiframe after the code group synchronization. 00 = 0 multiframe delays 01 = 1 multiframe delay 10 = 2 multiframe delays 11 = 3 multiframe delays

### 8.5.11.5 Register 006h (address = 006h), JESD Digital Page

**Figure 175. Register 006h**

7	6	5	4	3	2	1	0
SCRAMBLE EN	0	0	0	0	0	0	0
R/W-0h	W-0h						

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 63. Register 006h Field Descriptions**

Bit	Field	Type	Reset	Description
7	SCRAMBLE EN	R/W	0h	This bit is the scramble enable bit in the JESD204B interface. 0 = Scrambling disabled 1 = Scrambling enabled
6-0	0	W	0h	Must write 0

### 8.5.11.6 Register 007h (address = 007h), JESD Digital Page

**Figure 176. Register 007h**

7	6	5	4	3	2	1	0
0	0	0					FRAMES PER MULTIFRAME (K)
W-0h	W-0h	W-0h					R/W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 64. Register 007h Field Descriptions**

Bit	Field	Type	Reset	Description
7-5	0	W	0h	Must write 0
4-0	FRAMES PER MULTIFRAME (K)	R/W	0h	These bits set the number of multiframe. Actual K is the value in hex + 1 (that is, 0Fh is K = 16).

### 8.5.11.7 Register 016h (address = 016h), JESD Digital Page

**Figure 177. Register 016h**

7	6	5	4	3	2	1	0
0		40x MODE		0	0	0	0
W-0h		R/W-0h		W-0h	W-0h	W-0h	W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 65. Register 016h Field Descriptions**

Bit	Field	Type	Reset	Description
7	0	W	0h	Must write 0
6-4	40x MODE	R/W	0h	This register must be set for 40X mode operation. 000 = Register is set for 20X and 80X mode 111 = Register must be set for 40X mode
3-0	0	W	0h	Must write 0

### 8.5.11.8 Register 017h (address = 017h), JESD Digital Page

**Figure 178. Register 017h**

7	6	5	4	3	2	1	0
0	0	0	0	Lane0 POL	Lane1 POL	Lane2 POL	Lane3 POL
W-0h	R/W-0h	R/W-0h	R/W-0h	W-0h	W-0h	W-0h	W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 66. Register 017h Field Descriptions**

Bit	Field	Type	Reset	Description
7	0	W	0h	Must write 0
6-4	0	R/W	0h	Must write 0
3-0	Lane[3:0] POL	W	0h	These bits set the polarity of the individual JESD output lanes. 0 = Polarity as given in the pinout (noninverted) 1 = Inverts polarity (positive, P, or negative, M)

### 8.5.11.9 Register 032h-035h (address = 032h-035h), JESD Digital Page

**Figure 179. Register 032h**

7	6	5	4	3	2	1	0

R/W-0h					W-0h	W-0h	W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Figure 182. Register 035h**

7	6	5	4	3	2	1	0
SEL EMP LANE 3					0	0	0
R/W-0h					W-0h	W-0h	W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 67. Register 032h-035h Field Descriptions**

Bit	Field	Type	Reset	Description
7-2	SEL EMP LANE	R/W	0h	<p>These bits select the amount of de-emphasis for the JESD output transmitter. The de-emphasis value in dB is measured as the ratio between the peak value after the signal transition to the settled value of the voltage in one bit period.</p> <p>0 = 0 dB  1 = -1 dB  3 = -2 dB  7 = -4.1 dB  15 = -6.2 dB  31 = -8.2 dB  63 = -11.5 dB</p>
1-0	0	W	0h	Must write 0

#### 8.5.11.10 Register 036h (address = 036h), JESD Digital Page

**Figure 183. Register 036h**

7	6	5	4	3	2	1	0
0	CMOS SYNCB	0	0	0	0	0	0
W-0h	R/W-0h	W-0h	W-0h	W-0h	W-0h	W-0h	W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 68. Register 036h Field Descriptions**

Bit	Field	Type	Reset	Description
7	0	W	0h	Must write 0
6	CMOS SYNCB	R/W	0h	<p>This bit enables single-ended control of SYNCB using the GPIO4 pin (pin 63). The differential SYNCB input is ignored. Set the EN CMOS SYNCB bit and keep the CH bit high to make this bit effective.</p> <p>0 = Differential SYNCB input  1 = Single-ended SYNCB input using pin 63</p>
5-0	0	W	0h	Must write 0

#### 8.5.11.11 Register 037h (address = 037h), JESD Digital Page

**Figure 184. Register 037h**

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	PLL MODE
W-0h	R/W-0h						

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 69. Register 037h Field Descriptions**

Bit	Field	Type	Reset	Description
7-2	0	W	0h	Must write 0
1-0	PLL MODE	R/W	0h	<p>These bits select the PLL multiplication factor; see the JESD tables in the <a href="#">JESD204B Frame Assembly</a> section for settings.</p> <p>00 = 20X mode  01 = 16X mode  10 = 40x mode (the 40x MODE bit in register 16h must also be set)  11 = 80x mode</p>

### 8.5.11.12 Register 03Ch (address = 03Ch), JESD Digital Page

**Figure 185. Register 03Ch**

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	EN CMOS SYNCB
W-0h	R/W-0h						

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 70. Register 03Ch Field Descriptions**

Bit	Field	Type	Reset	Description
7-1	0	W	0h	Must write 0
0	EN CMOS SYNCB	R/W	0h	<p>Set this bit and the CMOS SYNCB bit high to provide a single-ended SYNC input to the device instead of differential. Also, keep the CH bit high. Thus:</p> <ol style="list-style-type: none"> <li>1. Select the JESD digital page.</li> <li>2. Write address 7036h with value 40h.</li> <li>3. Write address 703Ch with value 01h.</li> </ol>

### 8.5.11.13 Register 03Eh (address = 03Eh), JESD Digital Page

**Figure 186. Register 03Eh**

7	6	5	4	3	2	1	0
0	MASK CLKDIV SYSREF	MASK NCO SYSREF	0	0	0	0	0
W-0h	R/W-0h	R/W-0h	W-0h	W-0h	W-0h	W-0h	W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 71. Register 03Eh Field Descriptions**

Bit	Field	Type	Reset	Description
7	0	W	0h	Must write 0
6	MASK CLKDIV SYSREF	R/W	0h	Use this bit to mask the SYSREF going to the input clock divider. 0 = Input clock divider is reset when SYSREF is asserted (that is, when SYSREF transitions from low to high) 1 = Input clock divider ignores SYSREF assertions
5	MASK NCO SYSREF	R/W	0h	Use this bit to mask the SYSREF going to the NCO in the DDC block and LMFC counter of the JESD interface. 0 = NCO phase and LMFC counter are reset when SYSREF is asserted (that is, when SYSREF transitions from low to high) 1 = NCO and LMFC counter ignore SYSREF assertions
4-0	0	W	0h	Must write 0

### 8.5.12 Decimation Filter Page

Direct Addressing, 16-Bit Address, 5000h for Channel A, 5800h for Channel B

#### 8.5.12.1 Register 000h (address = 000h), Decimation Filter Page

**Figure 187. Register 000h**

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	DDC EN
W-0h	R/W-0h						

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

**Table 72. Register 000h Field Descriptions**

Bit	Field	Type	Reset	Description
7-1	0	W	0h	Must write 0
0	DDC EN	R/W	0h	This bit enables the decimation filter and disables the bypass mode. 0 = Do not use 1 = Decimation filter enabled

### 8.5.12.2 Register 001h (address = 001h), Decimation Filter Page

**Figure 188. Register 001h**

7	6	5	4	3	2	1	0
0	0	0	0				DECIM FACTOR

**Figure 222. Register 00Ah**

7	6	5	4	3	2	1	0
				BLKTHLL			
				R/W-0h			

LEGEND: R/W = Read/Write; -n = value after reset

**Table 101. Register 007h-00Ah Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	BLKTHHH BLKTHHL BLKTHLH BLKTHLL	R/W	0h	These registers set the four different thresholds for the hysteresis function threshold values from 0 to 256 (2TH), where 256 is equivalent to the peak amplitude. Example: BLKTHHH is set to -2 dBFS from peak: $10^{(-2/20) \times 256} = 203$ , then set 5407h, 5C07h = CBh.

### 8.5.13.5 Register 00Bh-00Ch (address = 00Bh-00Ch), Power Detector Page

**Figure 223. Register 00Bh**

7	6	5	4	3	2	1	0
DWELL[7:0]							
R/W-0h							

LEGEND: R/W = Read/Write; -n = value after reset

**Figure 224. Register 00Ch**

7	6	5	4	3	2	1	0
DWELL[15:8]							
R/W-0h							

LEGEND: R/W = Read/Write; -n = value after reset

**Table 102. Register 00Bh-00Ch Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	DWELL	R/W	0h	DWELL time counter. When the computed block peak crosses the upper thresholds BLKTHHH or BLKTHLH, the peak detector output flags are set. In order to be reset, the computed block peak must remain continuously lower than the lower threshold (BLKTHHL or BLKTHLL) for the period specified by the DWELL value. This threshold is 16 bits, is specified in terms of $f_S / 8$ clock cycles, and must be set to 0 for the crossing detector. Example: if $f_S = 3$ GSPS, $f_S / 8 = 375$ MHz, and DWELL = 0100h then the DWELL time = $2^8 / 375$ MHz = 1.36 $\mu$ s.

### 8.5.13.6 Register 00Dh (address = 00Dh), Power Detector Page

**Figure 225. Register 00Dh**

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	FILTOLPSEL

**Table 107. Register 01Dh-01Eh Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	DWELLIIR	R/W	0h	DWELL time counter for the IIR output comparators. When the IIR filter output crosses the upper thresholds FIL0THH or FIL1THH, the IIR peak detector output flags are set. In order to be reset, the output of the IIR filter must remain continuously lower than the lower threshold (FIL0THL or FIL1THL) for the period specified by the DWELLIIR value. This threshold is 16 bits and is specified in terms of $f_S / 8$ clock cycles. Example: if $f_S = 3$ GSPS, $f_S / 8 = 375$ MHz, and DWELLIIR = 0100h, then the DWELL time = 29 / 375 MHz = 1.36 $\mu$ s.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

#### 9.1.1 Start-Up Sequence

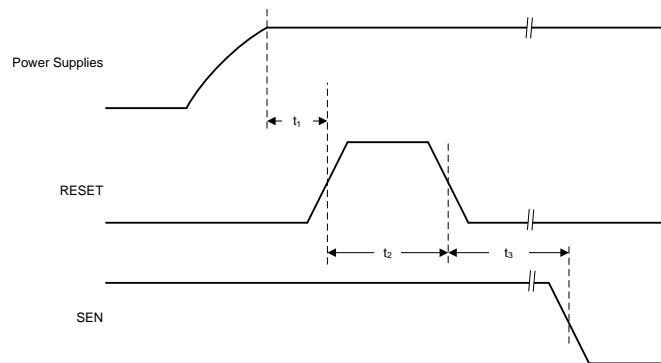

The steps in [Table 117](#) are recommended as the power-up sequence when the ADC32RF8x is in the decimation-by-4 complex output mode.

**Table 117. Initialization Sequence**

STEP	DESCRIPTION	PAGE, REGISTER ADDRESS AND DATA	COMMENT
1	Supply all supply voltages. There is no required power-supply sequence for the 1.15 V, 1.2 V, and 1.9 V supplies, and can be supplied in any order.	—	—
2	Provide the SYSREF signal.	—	—
3	Pulse a hardware reset (low-to-high-to-low) on pins 33 and 34.	—	—
4	Write the register addresses described in the <i>PowerUpConfig</i> file.	See the files located in <a href="#">SBAA226</a>	The <i>Power-up config</i> file contains analog trim registers that are required for best performance of the ADC. Write these registers every time after power up.
5	Write the register addresses mentioned in the <i>ILConfigNyqX_ChA</i> file, where X is the Nyquist zone.	See the files located in <a href="#">SBAA226</a>	Based on the signal band of interest, provide the Nyquist zone information to the device.
6	Write the register addresses mentioned in the <i>ILConfigNyqX_ChB</i> file, where X is the Nyquist zone.	See the files located in <a href="#">SBAA226</a>	This step optimizes device' performance by reducing interleaving mismatch errors.
6.1	Wait for 50 ms for the device to estimate the interleaving errors.	—	—
7	Depending upon the Nyquist band of operation, choose and write the registers from the appropriate file, <i>NLConfigNyqX_ChA</i> , where X is the Nyquist zone.	See the files located in <a href="#">SBAA226</a>	Third-order nonlinearity of the device is optimized by this step for channel A.
7.1	Depending upon the Nyquist band of operation, choose and write the registers from the appropriate file, <i>NLConfigNyqX_ChB</i> , where X is the Nyquist zone.	See the files located in <a href="#">SBAA226</a>	Third-order nonlinearity of the device is optimized by this step for channel B.
8	Configure the JESD interface and DDC block by writing the registers mentioned in the <i>DDC Config</i> file.	See the files located in <a href="#">SBAA226</a>	Determine the DDC and JESD interface LMFS options. Program these options in this step.

### 9.1.2 Hardware Reset

Timing information for the hardware reset is shown in [Figure 253](#) and [Table 118](#).

**Figure 253. Hardware Reset Timing Diagram**

**Table 118. Hardware Reset Timing Information**

		MIN	TYP	MAX	UNIT
$t_1$	Power-on delay from power-up to active high RESET pulse	1			ms
$t_2$	Reset pulse duration: active high RESET pulse duration	1			$\mu$ s
$t_3$	Register write delay from RESET disable to SEN active	100			ns

### 9.1.3 SNR and Clock Jitter

The signal-to-noise ratio (SNR) of the ADC is limited by three different factors: quantization noise, thermal noise, and jitter, as shown in [Equation 5](#). The quantization noise is typically not noticeable in pipeline converters and is 84 dB for a 14-bit ADC. The thermal noise limits the SNR at low input frequencies and the clock jitter sets the SNR for higher input frequencies.

$$\text{SNR}_{\text{ADC}} [\text{dBc}] = -20 \log \sqrt{\left( 10^{\frac{\text{SNR}_{\text{Quantization Noise}}}{20}} \right)^2 + \left( 10^{\frac{\text{SNR}_{\text{Thermal Noise}}}{20}} \right)^2 + \left( 10^{\frac{\text{SNR}_{\text{Jitter}}}{20}} \right)^2} \quad (5)$$

The SNR limitation resulting from sample clock jitter can be calculated by [Equation 6](#):

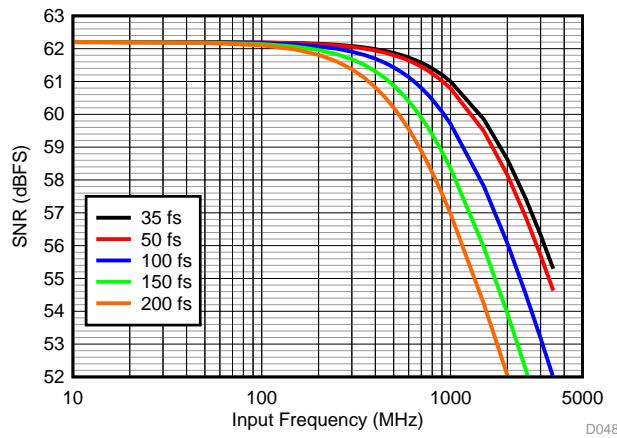

$$\text{SNR}_{\text{Jitter}} [\text{dBc}] = -20 \log(2\pi \times f_{\text{N}} \times t_{\text{Jitter}}) \quad (6)$$

The total clock jitter ( $T_{\text{Jitter}}$ ) has two components: the internal aperture jitter (90 fs) is set by the noise of the clock input buffer and the external clock jitter.  $T_{\text{Jitter}}$  can be calculated by [Equation 7](#):

$$t_{\text{Jitter}} = \sqrt{(t_{\text{Jitter, Ext_Clock_Input}})^2 + (t_{\text{Aperture_ADC}})^2} \quad (7)$$

External clock jitter can be minimized by using high-quality clock sources and jitter cleaners as well as band-pass filters at the clock input. A faster clock slew rate also improves the ADC aperture jitter.

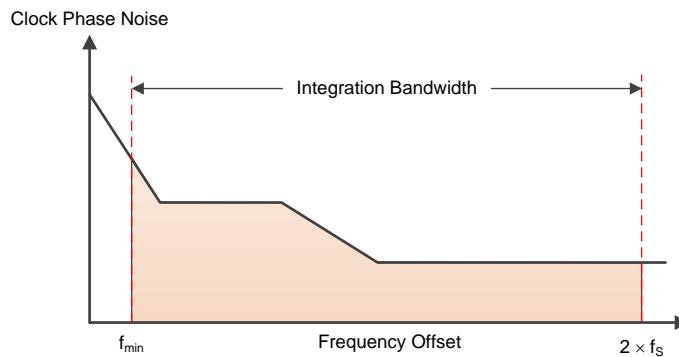

The ADC32RF8x has a thermal noise of approximately 63 dBFS and an internal aperture jitter of 90 fs. The SNR, depending on the amount of external jitter for different input frequencies, is shown in [Figure 254](#).

**Figure 254. ADC SNR vs Input Frequency and External Clock Jitter**

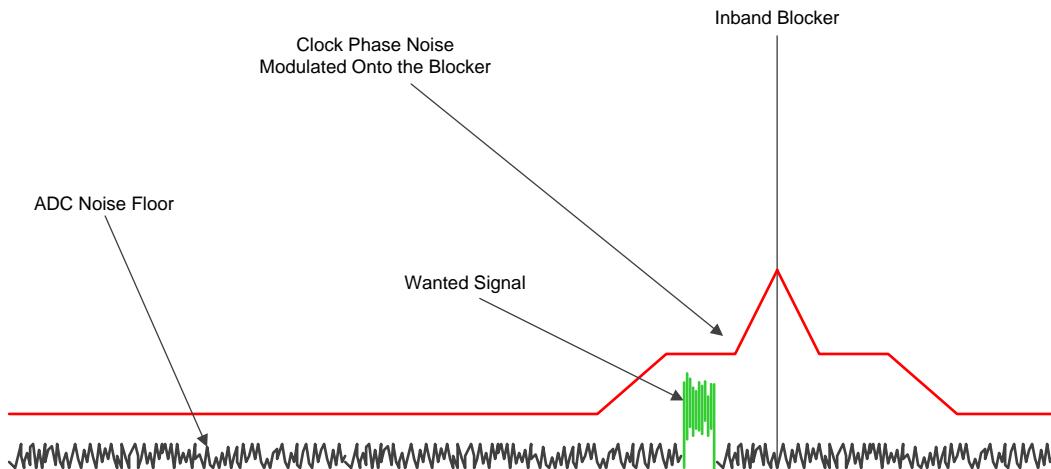

### 9.1.3.1 External Clock Phase Noise Consideration

External clock jitter can be calculated by integrating the phase noise of the clock source out to approximately two times of the ADC sampling rate ( $2 \times f_S$ ), as shown in [Figure 255](#). In order to maximize the ADC SNR, an external band-pass filter is recommended to be used on the clock input. This filter reduces the jitter contribution from the broadband clock phase noise floor by effectively reducing the integration bandwidth to the pass band of the band-pass filter. This method is suitable when estimating the overall ADC SNR resulting from clock jitter at a certain input frequency.

**Figure 255. Integration Bandwidth for Extracting Jitter from Clock Phase Noise**

However, when estimating the affect of a nearby blocker (such as a strong in-band interferer to the sensitivity, the phase noise information can be used directly to estimate the noise budget contribution at a certain offset frequency, as shown in [Figure 256](#).

**Figure 256. Small Wanted Signal in Presence of Interferer**

At the sampling instant, the phase noise profile of the clock source convolves with the input signal (for example, the small wanted signal and the strong interferer merge together). If the power of the clock phase noise in the signal band of interest is too large, the wanted signal cannot not be recovered.

The resulting equivalent phase noise at the ADC input is also dependent on the sampling rate of the ADC and frequency of the input signal. The ADC sampling rate scales the clock phase noise, as shown in [Equation 8](#).

$$\text{ADC}_{\text{NSD}} (\text{dBc / Hz}) = \text{PN}_{\text{CLK}} (\text{dBc / Hz}) - 20 \times \log \left( \frac{f_S}{f_{\text{IN}}} \right) \quad (8)$$

Using this information, the noise contribution resulting from the phase noise profile of the ADC sampling clock can be calculated.

### 9.1.4 Power Consumption in Different Modes

The ADC32RF8x consumes approximately 6.6 W of power when both channels are active with a divide-by-4 complex output. When different DDC options are used, the power consumption on the DVDD supply changes by a small amount but remains unaffected on other supplies. In the applications requiring just one channel to be active, channel A must be chosen as the active channel and channel B can be powered down. Power consumption reduces to approximately 4 W in single-channel operation with a divide-by-4 option at a 2949.12-MSPS device clock rate.

Table 119 shows power consumption in different DDC modes for dual-channel and single-channel operation.

**Table 119. Power Consumption in Different DDC Modes (Sampling Clock Frequency,  $f_S = 3$  GSPS)**

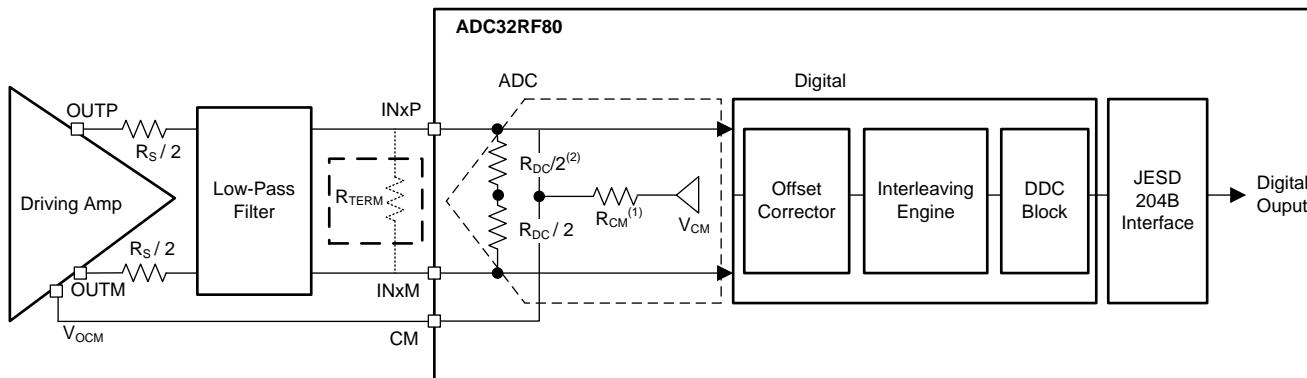

DECIMATION OPTION	ACTIVE CHANNEL	ACTIVE DDC	AVDD19 (mA)	AVDD (mA)	DVDD (mA)	TOTAL POWER (mW)
Divide-by-4	Channels A, B	Single	1777	970	1785	6545
Divide-by-8	Channels A, B	Dual	1777	973	1960	6749
Divide-by-8	Channels A, B	Single	1777	973	1730	6485
Divide-by-16	Channels A, B	Dual	1777	972	1971	6761
Divide-by-16	Channels A, B	Single	1777	972	1705	6455

Divide-by-32	Channel A	Dual	956	788	1104	3992
Divide-by-32	Channel A	Single	956	786	978	3845

### 9.1.5 Using DC Coupling in the ADC32RF8x

The ADC32RF8x can be used in dc-coupling applications. However, the following points must be considered when designing the system:

1. Ensure that the correct common-mode voltage is used at the ADC analog inputs.

The analog inputs are internally self-biased to  $V_{CM}$  through approximately a  $33\Omega$  resistor. The internal biasing resistors also function as a termination resistor. However, if a different termination is required, the external resistor  $R_{TERM}$  can be differentially placed between the analog inputs, as shown in Figure 257. The amplifier  $V_{OCM}$  pin is recommended to be driven from the CM pin of the ADC to help the amplifier output common-mode voltage track the required common-mode voltage of the ADC.

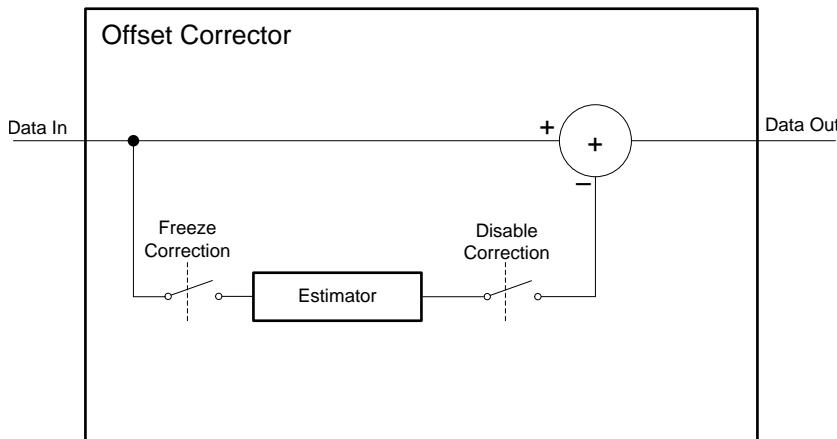

Copyright © 2016, Texas Instruments Incorporated

- (1) Set the INCR CM IMPEDANCE bit to increase the RCM from  $0\Omega$  to  $> 5000\Omega$ .
- (2)  $R_{DC}$  is approximately  $65\Omega$ .

**Figure 257. The ADC32RF8x in a DC-Coupling Application**

2. Ensure that the correct SPI settings are written to the ADC.

As shown in Figure 258, the ADC32RF8x has a digital block that estimates and corrects the offset mismatch among four interleaving ADC cores for a given channel.

**Figure 258. Offset Corrector in the ADC32RF8x**

The offset corrector block nullifies dc,  $f_S / 8$ ,  $f_S / 4$ ,  $3 f_S / 8$ , and  $f_S / 2$ . The resulting spectrum becomes free from static spurs at these frequencies. The corrector continuously processes the data coming from the interleaving ADC cores and cannot distinguish if the tone at these frequencies is part of signal or if the tone originated from a mismatch among the interleaving ADC cores. Thus, in applications where the signal is present at these frequencies, the offset corrector block can be bypassed.

### 9.1.5.1 Bypassing the Offset Corrector Block

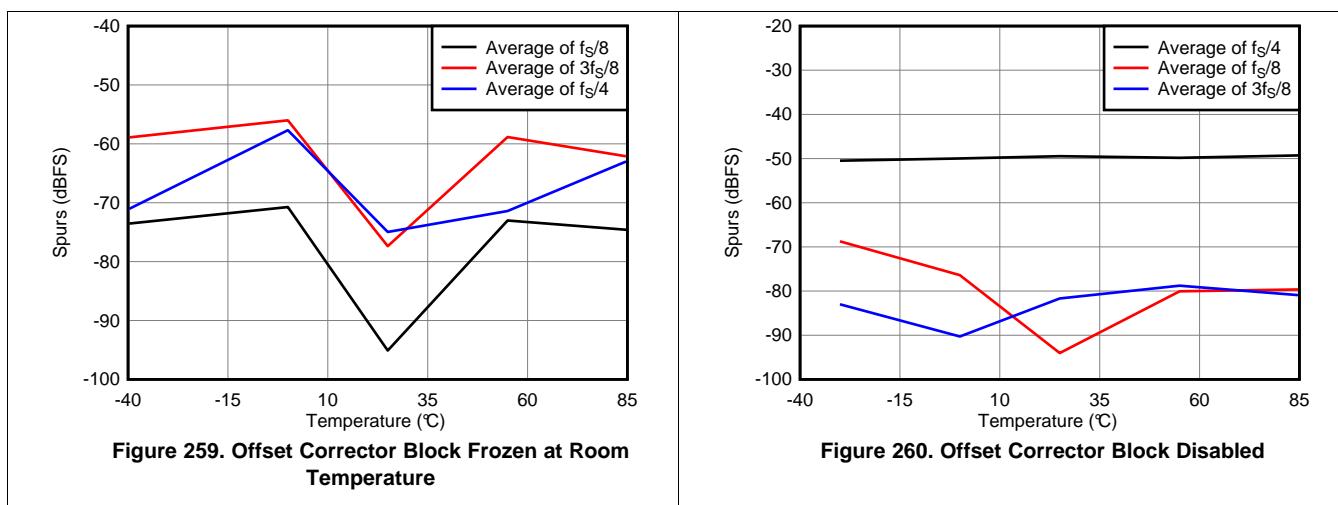

When the offset corrector is bypassed, offset mismatch among interleaving ADC cores appears in the ADC output spectrum. To correct the effects of mismatch, place the ADC in an idle channel state (no signal at the ADC inputs) and the corrector must be allowed to run for some time to estimate the mismatch, then the corrector is frozen so that the last estimated value is held. Required register writes are provided in [Table 120](#).

**Table 120. Freezing and Bypassing the Offset Corrector Block**

STEP	REGISTER WRITE	COMMENT
<b>STEPS FOR FREEZING THE CORRECTOR BLOCK</b>		
1	—	Signal source is turned off. The device detects an idle channel at its input.
2	—	Wait for at least 0.4 ms for the corrector to estimate the internal offset
3	Address 4001h, value 00h	Select Offset Corr Page Channel A

	Address 6068h, value 46h	Disable the corrector for channel B

#### 9.1.5.1.1 Effect of Temperature

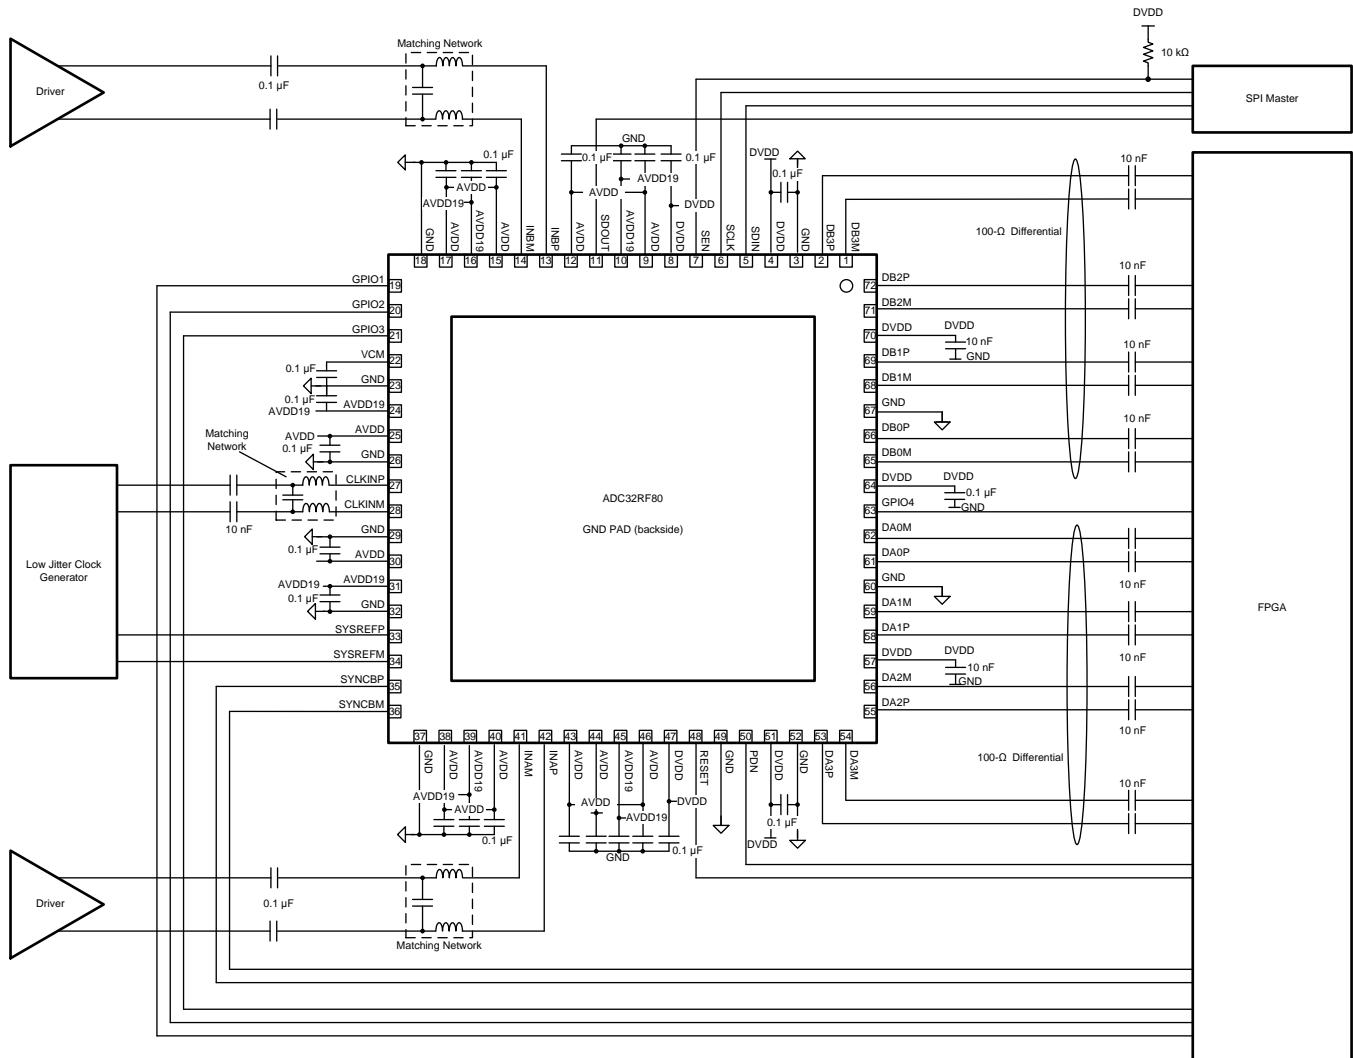

[Figure 259](#) and [Figure 260](#) show the behavior of  $n f_s / 8$  tones with respect to temperature when the offset corrector block is frozen or disabled.

## 9.2 Typical Application

The ADC32RF8x is designed for wideband receiver applications demanding high dynamic range over a large input frequency range. A typical schematic for an ac-coupled receiver is shown in [Figure 261](#).

Decoupling capacitors with low ESL are recommended to be placed as close as possible at the pins indicated in [Figure 261](#). Additional capacitors can be placed on the remaining power pins.

Copyright © 2016, Texas Instruments Incorporated

**Figure 261. Typical Application Implementation Diagram**

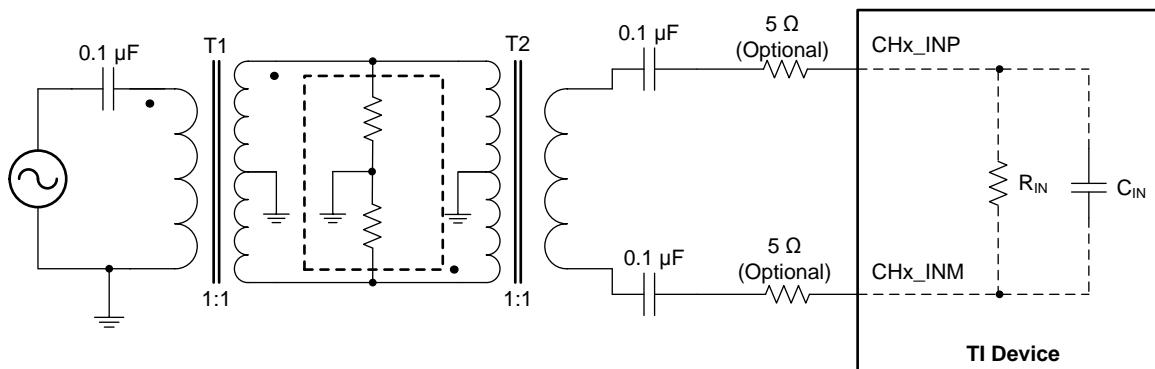

## Typical Application (continued)

### 9.2.1 Design Requirements

#### 9.2.1.1 Transformer-Coupled Circuits

Typical applications involving transformer-coupled circuits are discussed in this section. To ensure good amplitude and phase balance at the analog inputs, transformers (such as TC1-1-13 and TC1-1-43) can be used from the dc to 1000-MHz range and from the 1000-MHz to 4-GHz range of input frequencies, respectively. When designing the driving circuits, the ADC input impedance (or SDD11) must be considered.

By using the simple drive circuit of [Figure 262](#), uniform performance can be obtained over a wide frequency range. The buffers present at the analog inputs of the device help isolate the external drive source from the switching currents of the sampling circuit.

Copyright © 2016, Texas Instruments Incorporated

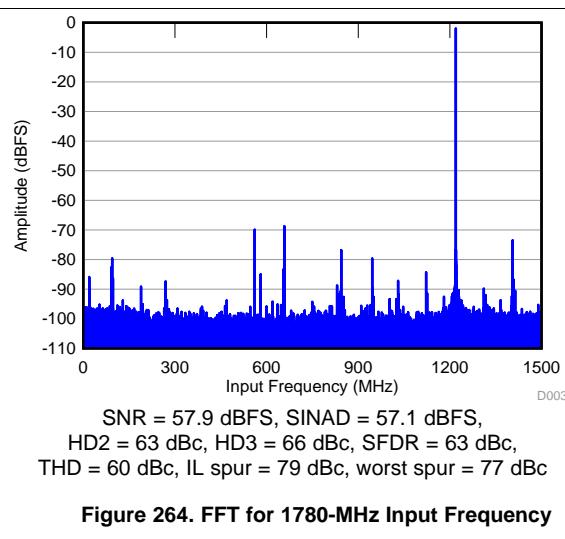

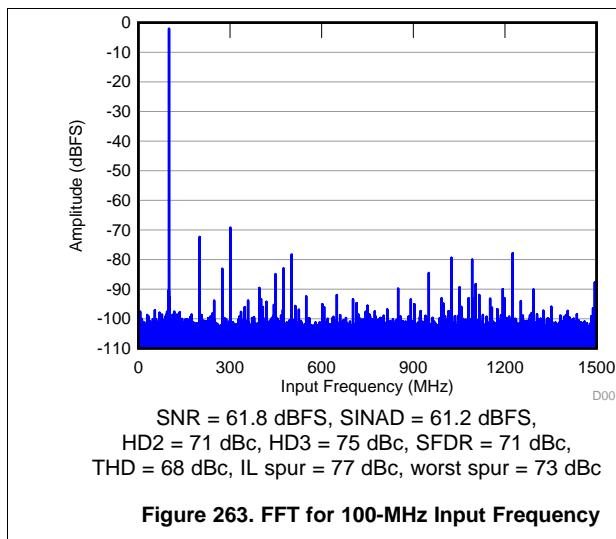

**Figure 262. Input Drive Circuit**

### 9.2.2 Detailed Design Procedure

For optimum performance, the analog inputs must be driven differentially. This architecture improves common-mode noise immunity and even-order harmonic rejection. A small resistor (5 Ω to 10 Ω) in series with each input pin is recommended to damp out ringing caused by package parasitics, as shown in [Figure 262](#).

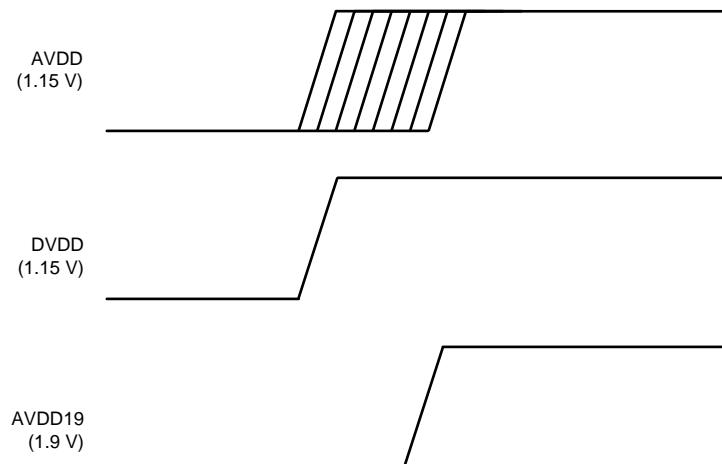

### 9.2.3 Application Curves

[Figure 263](#) and [Figure 264](#) show the typical performance at 100 MHz and 1780 MHz, respectively.

## 10 Power Supply Recommendations

The DVDD power supply (1.15 V) must be stable before ramping up the AVDD19 supply (1.9 V), as shown in [Figure 265](#). The AVDD supply (1.15 V) can come up in any order during the power sequence. The power supplies can ramp up at any rate and there is no hard requirement for the time delay between DVDD (1.15 V) ramping up to AVDD (1.9 V) ramping up (which can be in orders of microseconds but is recommended to be a few milliseconds).

**Figure 265. Power Sequencing for the ADC32RF8x Family of devices**

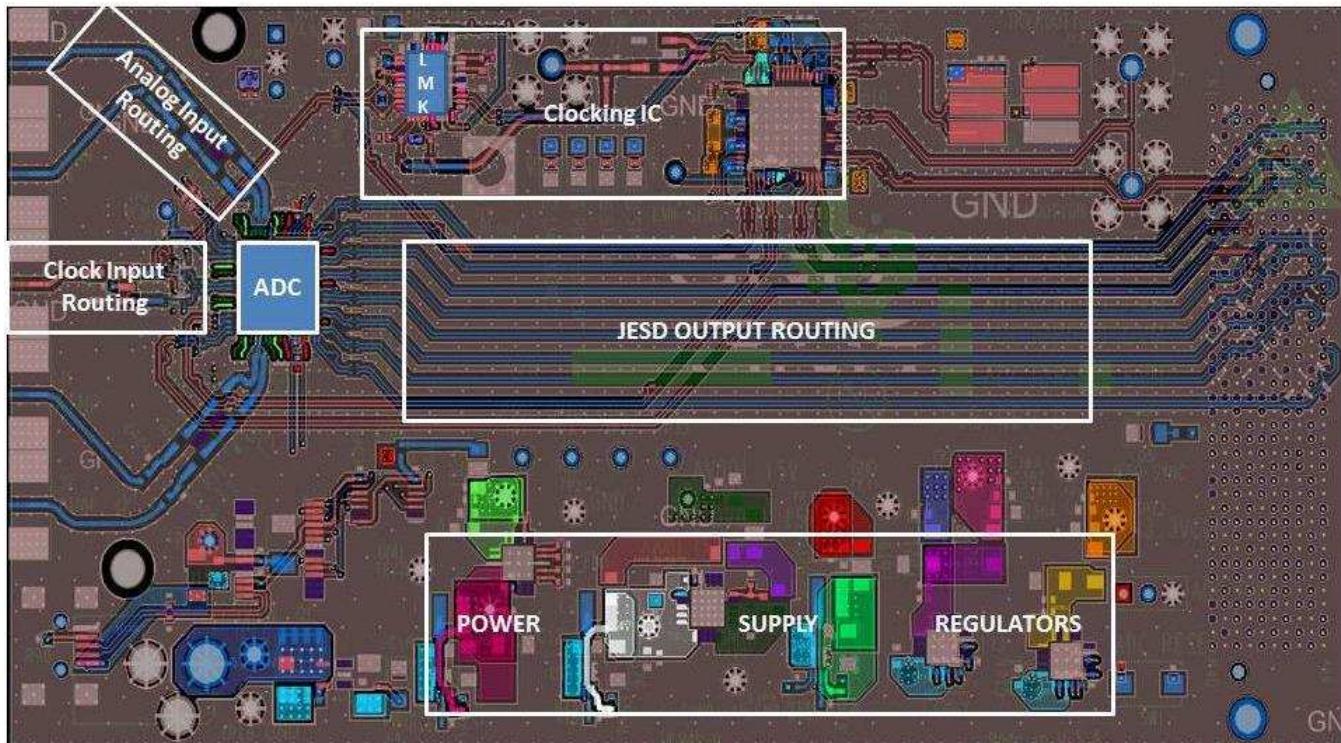

## 11 Layout

### 11.1 Layout Guidelines

The device evaluation module (EVM) layout can be used as a reference layout to obtain the best performance. A layout diagram of the EVM top layer is provided in [Figure 266](#). The [ADC32RF45/RF80 EVM Quick Startup Guide](#) provides a complete layout of the EVM. Some important points to remember during board layout are:

- Analog inputs are located on opposite sides of the device pinout to ensure minimum crosstalk on the package level. To minimize crosstalk onboard, the analog inputs must exit the pinout in opposite directions, as shown in the reference layout of [Figure 266](#) as much as possible.
- In the device pinout, the sampling clock is located on a side perpendicular to the analog inputs in order to minimize coupling. This configuration is also maintained on the reference layout of [Figure 266](#) as much as possible.
- Keep digital outputs away from the analog inputs. When these digital outputs exit the pinout, the digital output traces must not be kept parallel to the analog input traces because this configuration can result in coupling from the digital outputs to the analog inputs and degrade performance. All digital output traces to the receiver [such as field-programmable gate arrays (FPGAs) or application-specific integrated circuits (ASICs)] must be matched in length to avoid skew among outputs.
- At each power-supply pin (AVDD, DVDD, or AVDD19), keep a 0.1- $\mu$ F decoupling capacitor close to the device. A separate decoupling capacitor group consisting of a parallel combination of 10- $\mu$ F, 1- $\mu$ F, and 0.1- $\mu$ F capacitors can be kept close to the supply source.

## 11.2 Layout Example

**Figure 266. ADC32RF8xEVM Layout**

## 12 Device and Documentation Support

### 12.1 Documentation Support

#### 12.1.1 Related Documentation

For related documentation see the following:

- [ADC32RF45/RF80 EVM Quick Startup Guide](#) (SLAU620)
- [Configuration Files for the ADC32RF45](#) (SBAA226)

### 12.2 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

**Table 121. Related Links**

PARTS	PRODUCT FOLDER	SAMPLE & BUY	TECHNICAL DOCUMENTS	TOOLS & SOFTWARE	SUPPORT & COMMUNITY
ADC32RF80	<a href="#">Click here</a>				
ADC32RF83	<a href="#">Click here</a>				

### 12.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 12.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** **TI's Engineer-to-Engineer (E2E) Community.** Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** **TI's Design Support** Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 12.5 Trademarks

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

### 12.6 Electrostatic Discharge Caution

 This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

 ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 12.7 Glossary

**SLYZ022 — TI Glossary.**

This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ADC32RF80IRMPR	ACTIVE	VQFN	RMP	72	1500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	AZ32RF80	<b>Samples</b>
ADC32RF80IRMPT	ACTIVE	VQFN	RMP	72	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	AZ32RF80	<b>Samples</b>
ADC32RF83IRMPR	ACTIVE	VQFN	RMP	72	1500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	AZ32RF83	<b>Samples</b>
ADC32RF83IRMPT	ACTIVE	VQFN	RMP	72	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	AZ32RF83	<b>Samples</b>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.**OBSOLETE:** TI has discontinued the production of the device.(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.**TBD:** The Pb-Free/Green conversion plan has not been defined.**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

## PACKAGE OPTION ADDENDUM

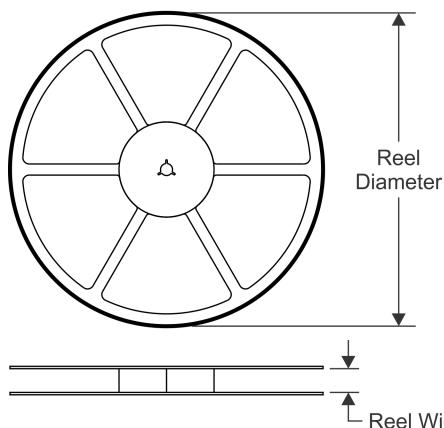

31-Jan-2017

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

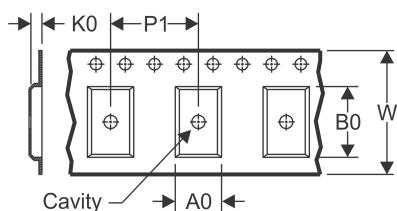

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

### REEL DIMENSIONS

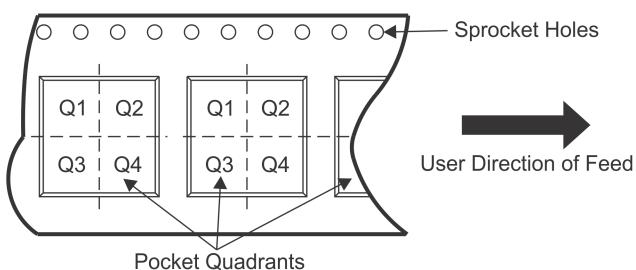

### TAPE DIMENSIONS

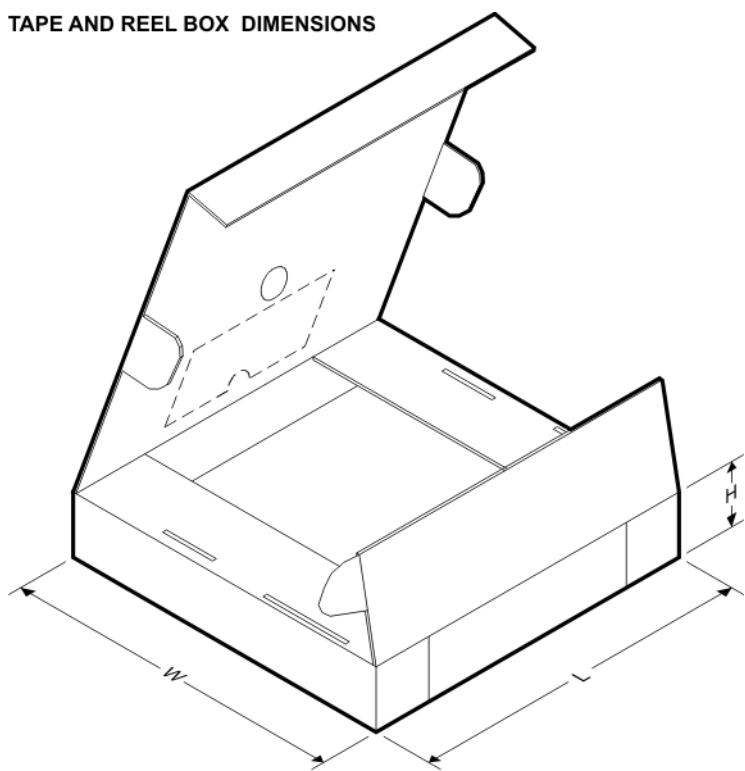

$A_0$	Dimension designed to accommodate the component width
$B_0$	Dimension designed to accommodate the component length
$K_0$	Dimension designed to accommodate the component thickness
$W$	Overall width of the carrier tape
$P_1$	Pitch between successive cavity centers

### QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	$A_0$ (mm)	$B_0$ (mm)	$K_0$ (mm)	$P_1$ (mm)	$W$ (mm)	Pin1 Quadrant

# RMP0072A

## PACKAGE OUTLINE

VQFN - 0.9 mm max height

VQFN

### NOTES:

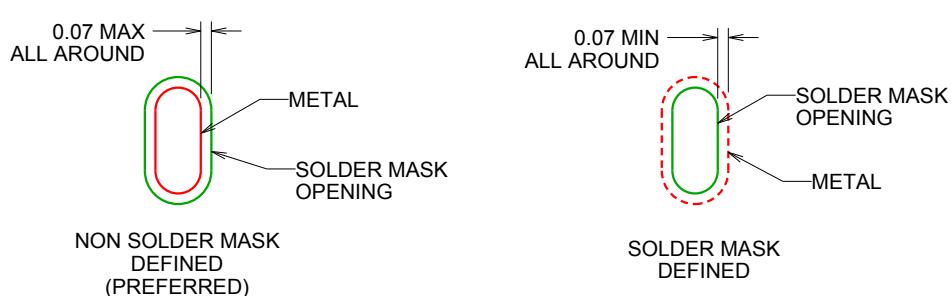

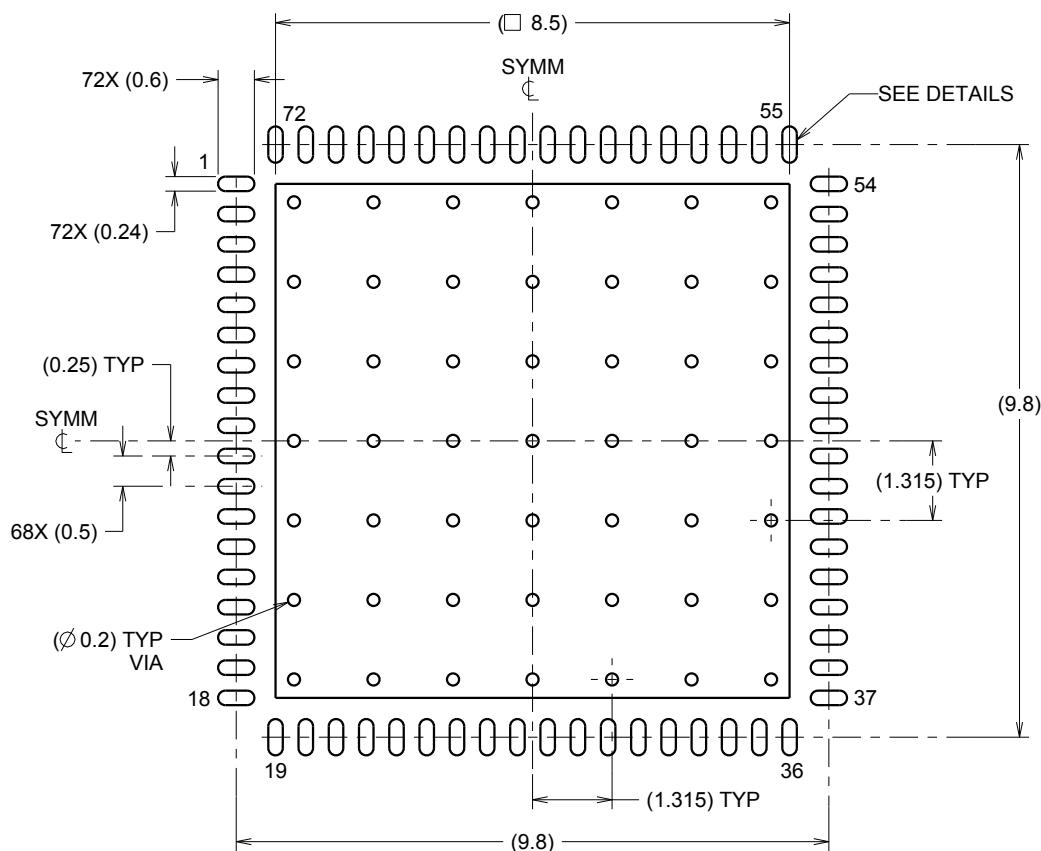

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

# EXAMPLE BOARD LAYOUT

RMP0072A

VQFN - 0.9 mm max height

NOTES: (continued)

5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

**TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.**

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
